Ice.—As we stated some time ago, it is very easy to use too much ice in hot weather in summer. What is very pleasing is not always conducive to health. Still, without ice many would have found the last season very trying to the temper if nothing else. In our common sunk well, with only a single wall, we have had and still have abundance; this is all the more gratifying, as, from our ponds having still little water, we should have far to go for ice, even if the frost were coming sharp enough to give us plenty on clean water. We are reminded by the short statement at pages 390 and 391, that we promised some dozen of our correspondents to say a few words before another season as to the causes of their failures. Well, in eight cases made known to us, where ice heaps had been made above ground, chiefly for milk, cream, and butter purposes, the ice had thawed when most wanted—in July, and later. In these cases the ice had been well broken, but it was left too wide and flat, and there was too little of it to give hopes of keeping. In the largest heap there were not above fifteen good cartloads. Now, though we do not wish to dis-

courage anyone, still we could not recommend the forming a heap expected to last over the summer, unless there were from thirty to forty good cartloads. It requires very great care to keep a few loads over the late spring and early summer months. In six cases made known to us, the failure, we think, was owing to using dryish litter, but not dry, to cover the heap out of doors; and the litter banked together, heated enough to melt the ice. When the ice is packed firmly where no water or ice-meltings can stay, and where, if possible, the ice has been watered outside and frozen into a lump, nothing is better for covering than, say, 6 inches of dry straw, more being added by degrees, so as to keep out heat, and yet not heat by fermentation. For the outside covering we have found nothing better than dry tree leaves, for if put on with a few branches over them the wind has little effect on them, and the heat of the sun scarcely any. Without these wheat straw neatly secured is the next best, put on so as to throw all wet from the inside covering. Such dry covering put on by degrees should not be less than 18 inches thick to keep out effectually the heat of summer.

In several cases where ice wells have been made under ground the failure was owing either to not having a drain at all, or having a drain, but untrapped with standing water, and therefore admitting the air of the general atmosphere in summer to the bottom of the well. A moist foggy atmosphere would thus be formed in the place, and nothing tends to melt ice more quickly. The more cool and dry the air over and about the ice the better it will keep. The moister and warmer the air is the sooner it will melt.

Reverting to the notice at page 390, we observe that a mistake was made, inasmuch as the inside wall was 9 inches thick instead of 4½ inches, the thickness of the outer wall. Be that as it may, we revert to the subject again because, from several notes, we find that though most people have an idea that double walls would alike keep out heat and cold, they cannot see, except through a sort of mist, that the most thorough acting of such double walls depends on the air enclosed being still—thoroughly shut in, and having no connection with the external atmosphere. We have been asked how it is, and as we never could satisfy ourselves as to the how, it is not likely that any answer we could give could satisfy others; nevertheless, the fact remains that whilst moving air is a good conductor of heat and cold, confined air is one of the best of non-conductors.

We will adduce a few facts in corroboration. First, A few years ago a doubter as to this property of confined air called upon us during a keen frost in January, after 2 or 3 inches of snow had fallen the previous night. He looked at a low house about 11 a.m. One half of it had a cloth run along the front lights, the inside temperature ranging from 45° to 50°; the other half had neat straw covers placed on the lower sashes instead of the cloth. There was not a ray of direct sun that day, but a cold clouded atmosphere. Well, as there was not much reason for uncovering early, at that hour the snow on the cloth lying against the glass was all melted and gone, and the cloth could be easily rolled up. But above the warmer house the snow lay on the straw covers just as it had fallen, not a bit of it showed any signs of melting. We attributed this to the air enclosed imperfectly between the glass and the cover, and the air so far shut up in every tube of straw. For such a purpose, the less mutilated the straw by flail or machine the more suitable it would be for such a purpose. We regret we are getting out of straw covers. Made as recommended in former volumes, there is no protection cheaper and more effective.

Secondly, We have a pit which we had built with hollow walls—that is, a 14-inch wall used-up little more bricks than a 9-inch wall. In the most severe frost we have never known the inside wall at all frosted. In the hottest summer weather the inside wall, unless where the sun beats upon it, is comparatively cool.

Thirdly, A gentleman was obliged to build a dairy in a rather exposed place. As far as we recollect there were double walls, but we forget whether they were 14-inch or 18-inch, double ceilings, and a double roof; but like our correspondent, "G. Y. M.," he would insist on there being a thorough circulation between the walls, ceilings, &c. The circulation of the air was to keep all right, and in the hot summer the milk soured, the cream moulded, and the butter run to oil. When the air became thoroughly confined, visitors on going into the pretty place in August and September exclaimed, "Oh, how nice and cool! so like an ice house!"

Lastly, for the present. Few who travel by rail between thirty to fifty and more miles of the metropolis could fail to notice, chiefly in the morning and evening, trucks and vans filled with long upright tin cans, which help to supply our great metropolis with milk, cream, &c., from the country. The chief difficulty is to get it sweet and fresh by rail from rather long distances. A friend of ours who does a large trade has, we believe, not had a single complaint for several of the last dry and hot summers. He first tried double-sided vessels, and filled the space between with ice and iced water; then, as ice failed, he tried cold spring water; then, like "G. Y. M.," page 390, he thought if there were openings at top and bottom for the air to circulate between the outer and the inner case, all would be well; but it was not well. The simple mode has been returned to of leaving well alone. The holes are securely corked up. The air in the space between the cases, say from 1 to 1½ inch in width, is kept still and confined, and with the good results above specified. That body of confined air would prevent the hottest sun acting on the milk inside far more effectually than if the space had been filled with the coldest iced water. Confined air might be used with good effect for many purposes in gardening, as well as for keeping ice houses cool.

We can only now find room for three hints. First, in such weather as that which we now have let air-giving be moderate, and chiefly at the top of the house, and that after the heat is rising. Air given at the top gets mollified before it reaches and refreshes the plants. Letting cold blasts of cold air into plant or tropical houses is all a delusion. Secondly, be cautious of firing, so as not to give too much heat in dull, cold, cloudy weather. Less cold air will be necessary if there is less use of the furnace. Study the weather, and give a little brisk fire early in the morning in preference to a high temperature at night. Thirdly, for most plants under glass use water from which the chill has been taken, say not colder than 50°; for tropical plants not under 60° or 70°; and in cool greenhouses, &c., especially avoid spilling any.—R. F.

TRADE CATALOGUES RECEIVED.

W. Cutbush & Son, Highgate, London, N.—*Descriptive Catalogue of Stove and Greenhouse Plants, Fruit Trees, &c.*

F. & A. Dickson and Sons, 106, Eastgate Street, and Upton Nurseries, Chester.—*Catalogue of Forest Trees, and Hardy and Ornamental Trees and Shrubs, &c.*

TO CORRESPONDENTS.

* * * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (*A Young Gardener*).—Chambers's "Arithmetic, First Course." (*Anxious*).—Hogg's "Fruit Manual" is out of print. Another and enlarged edition is preparing. (*A. H.*)—Upon the receipt of thirty-two post-office stamps with your direction, the "Pine-Apple Manual" will be sent to you post free. The "Florist and Pomologist" is published monthly.

ITALIAN SPRING GARDEN (*Huzlehurst*).—We have no doubt that the proposed planting of the Italian spring garden will look very well. We are rather surprised that you have no Crocuses, which would have told well. We would use all your 4's alike—yellow Tulips with blue Pansy edgings. The four 7's, white Hyacinths, we would surround with blue and purple Crocuses, or the Swiss Forget-me-not. The four 5's, scarlet Tulips, we would surround with white Crocuses, and striped blue Crocuses. The four 8's, Nemophila beds, we would border with yellow Crocuses; 9, beds of Rhododendrons, we would border with Snowdrops, and carpet with Silene pendula. The four 10 beds, border with Daisies; the four 11 beds, border with yellow Crocus.

PANS for AN ORCHARD (*Wyeside*).—In addition to the Seckle and Chamontel, which you have, plant Jargonelle, Louise Bonne of Jersey, and Winter Nells.

FRUIT TREES FOR EAST AND NORTH ASPECTS (*Warburton*).—A wall with an east aspect will suit a Chamontel and Beurré de Rance Pear, but for the former a warm soil and situation are necessary. Pears for the east well—Bergamotte Esperen, Beurré Bose, Marie Louise, Glon Morveau,

Joséphine de Malines, Passe Colmar, Crassane, Van Mons Léon Leclerc, and Ne plus Meuris. Of Plums you may have Green Gage, Jefferson, Coe's Golden Drop, Kirke's, Transparent Gage, Prince Englebert, Victoria, and Oullin's Golden. The north wall will only suit the Morello Cherry.

BLACK ALCANTHE GRAPE SMALL AND STONELESS (*Wyeside*).—The Alcanthe requires rather more heat than the Black Hamburgh. To make the berries stone and swell, before doing anything else to the Vine, we would pull the dry hand gently over the bunches when in bloom. If the hand were well powdered with the farina from other kinds, all the better. If afraid to use the hand, which answers admirably, use a soft camel-hair pencil, and have a little of the dust of other kinds on clean paper held below, and you can scatter it over the bunch in bloom.

VINE (*X. Sidmouth*).—It is a species, *Vitis laciniata*, the Parsley-leaved or Clotat Grape Vine.

PLANTING A SMALL COOL VINERY (*A Poor Working Man*).—We think the proposed construction of the vineery good. You can grow Grapes very well in an unheated house, but it should have a south aspect. We would so contrive that the border should be partly above the surrounding ground level, and entirely so if the situation is wet. Plant inside at about 1 foot from the front. You will have room for six Vines; plant the two end ones 15 inches from the ends, and divide the space equally into five parts, which will show you where the four Vines should be planted. Plant in spring just when the Vines are beginning to grow, or in March. Of kinds, we would have one Black Champion, two Black Hamburghs, one Foster's White Seedling, one Buckland Sweetwater, and one Trent-ham Black.

ARRANGING A FRUIT GARDEN (*A Cottage Gardener*).—We think your former plan much the best—i.e., a 12-foot border and a walk 3½ feet wide all round, with a centre bed or border of 12 feet. This we would dispose as follows: Take off at one end what you require for the ground vineries, leaving them with their ends north and south; but irrespective of them, we would have a row of cordon Apples all around, and then two rows of pyramid Pear, Apple, Plum, and Cherry trees, and devote the space between to Strawberries. You can devote the ground to bedding plants and Roses. To grow both well the centre bed would not be too large; but to mix flowers and fruit trees together is to have neither good, and we thought your original intention was to make your garden profitable. Flowers take from, instead of putting in the pocket.

GREENHOUSE ON EAST ASPECT—HYACINTHUS IN POTS (*H. H. M.*).—A greenhouse will answer on a site that gets all the morning sun up to one o'clock. To forward Hyacinths which have been potted some time they may be placed in a mild hothed; but if they are only newly potted they would do best plunged in sawdust in a cold frame.

SOIL FOR A MAGNOLIA (*J.*).—We have seen the Exmouth variety doing well in a compost of loam from rotted turves, the turf being pared off about 3 inches thick and laid up for six months. The turf was taken from a pasture where the soil was a strong or heavy loam. This we consider the best of soil for the plant, though it may sometimes be seen doing well in a peaty soil. For top-dressing nothing is so good as cow dung, but sheep droppings answer well.

HIDING BUILDINGS (*Leadbeater*).—We think the proposed poles and covering them with climbers would not be effectual. The finest screen we know would be of *Cupressus Lawsoniana*. A double row of this—the plants being 6 feet and the rows 3 feet apart, planting them in quincunx order—would give you a complete and beautiful screen in a few years. To form one more rapidly you might have a double row of *Thuja Lobbi*, as advised for the *Cupressus*; or you could obtain strong plants of the American *Arbor-Vitæ* that would be a block at once, and they may be planted so as to form a hedge. Plants 6 and 8 feet high can be safely moved.

PERIS SERRULATA VARIETIES—FILMY FERNS (*Fanny Fern*).—*Pteris serrulata cristata*, *P. serrulata polydactylon*, and *Pteris umbrosa* are all as hardy as *Pteris serrulata*. *Trichomanes radicans* will succeed in a moist atmosphere without watering over the fronds, and it will also succeed when the water is given over the foliage. Constant moisture is the first object to be aimed at, and we think it well not to water over the foliage. We have found it do best in a position where it is kept moist by a little water constantly dripping on the stone or near where it is growing. *Hymenophyllum tunbridgense* does not require so much moisture as *Trichomanes radicans*. It is best covered with a bell-glass and water given below. It also does not require to be so dark, but should be kept from bright sun.

EARLY TULIPS IN POTS (*D. M.*).—If you wish the Van Thol Tulips in pots to flower early, you may place them in the house, now that they are pushing above ground; give them a temperature of from 55° to 60°, and a position near the glass; when the flowers show colour, remove the pots to the house with a temperature of 49° to 45°, and the flowers will be finer and last longer than in the higher temperature. If the Tulips are not wanted for blooming early, they would do better in the last named temperature, in which they would flower from the middle of February.

TOP-DRESSING LAWN (*H. Fox*).—Cocoa-nut fibre, turf-parings and phosphate of lime would be an excellent top-dressing for a lawn. The phosphate we should prefer to salt. We would now have equal parts of the cocoa-nut fibre and turf-parings well mixed and turned over in a heap, and we would at the end of February turn the heap again, adding to it one part in ten of phosphate of lime. You may give the dressing at the rate of twenty cartloads per acre. Put it on in March, let it lie until the beginning of April, then rake the lawn well, and sow the lawn grass seeds as you propose, not being sparing of the Suckling Clover (*Trifolium minus*). Roll well after sowing.

CENTAUREA CANDIDISSIMA CULTURE (*Idem*).—That is the name of the plant of which you enclosed a leaf, one of the best white or silver-leaved plants for bedding. It requires to be taken up before frost, to be potted in light sandy soil, and to have a light airy position in a greenhouse, not giving much water—only enough to keep the foliage fresh. If safe from frost it is sufficient.

PLANTING LILIUM AURATUM OUT OF DOORS (*C. E.*).—You may now plant bulbs in the open ground, in good, rich, light soil well drained. A peaty soil is most suitable. Surround the bulbs with sand, and cover them with 2 or 3 inches of light soil.

PLANT FOR A SHADED WALL (*A. B.*).—Having tried Cotonaster, we fear your only hope is Ivy. The variegated kinds are, as a rule, of weaker

growth than the green-leaved. We would try *Hedera rhombœa variegata*, and argentea major, two of the most free-growing variegated sorts. The New Silver-striped is, however, one of the finest. We should plant the Irish Ivy and Regner's Ivy (*H. Regneriana*), the finest of all the green-leaved sorts.

ROSES IN POTS (G. B.).—The Roses having been potted in spring we would not now shake them out and repot them, but we would see that the drainage was good, making it so if it did not prove satisfactory. Then remove the surface soil down to the roots, and replace it with fresh rich compost. The Vines in pots, not of a size fit for fruiting, we would at once cut down, shake out, and place in pots suitably large to hold the roots without cramping. Of course, you will shift the Vines into larger pots when they have started into free growth, giving the fruiting size by May.

BRIARS FOR ROSE STOCKS (Marchal Niel).—The Briar for budding is not the Sweet Briar, but the Dog-Rose Briar. Select out of the hedges stems with clean, healthy bark and firm spines. Take them up carefully with a mattock, and cut the jagged ends of the roots to a uniform radius. Cut off all the branches, and head the Briar back to the required height. They should not be, except for pendulous or drooping trees, more than 3 feet high, as if the sort budded should grow well you cannot see the blooms without pulling the twig down. Eighteen inches or 2 feet I think the best height. If the sort budded do not grow well, one of two things will happen—either the Rose will deteriorate the Briar, or the Briar will deteriorate the Rose. Briars with bad growers on them are soon covered with Lichens or Moss. A wash of fresh-slaked lime and a little salt dissolved in water is the best cure for this. After planting the stocks mulch them, and keep them mulched next summer, and well water the roots two or three days before budding, also occasionally afterwards. After budding the Briar, tie a leaf over the bud for a day or so. Nurserymen do not usually sell Manetti cuttings.—W. F. RADCLIFFE.

ROSE CUTTINGS (Capt. G.).—Some of the hardiest Hybrid Perpetuals will strike from cuttings taken off the tree and put into the open ground in November, but it requires a favourable soil and situation. The wood should be well ripened, and with a heel to it—i.e., a side shoot of the current year's growth taken with a piece of the branch from which it sprang. The soil must not be too heavy, and the rows where the cuttings are planted should not be exposed to the full sun. The percentage, however, of failure is in most places very great, and far more satisfactory results can be obtained by taking off cuttings in August and September, and striking them in an old spent lotted or Cucumber frame, putting a layer of fresh soil with a little sharp sand at the top, and keeping the frame shaded and close at first. Protect in winter, and allow the cuttings to remain till spring, when they can either be potted off or planted out in nursery rows. Cuttings will also strike in pots in a cold frame with proper attention to shading and watering. Roses can likewise be obtained on their own roots by layering, where they are grown as dwarfs on the Manetti.

SELECT ROSES—TRANSPLANTING THEM (Spatius).—I do not know why Compe d'Hebe was called the "Queen's Rose." The thirteen Roses which you gave your friend are a good collection. As you wish to give another dozen or so I name Madame Victor Verdier, brilliant red; Pierre Notting, purple red; William Griffiths, salmon rose; Madame Clémence Jougou, deep rose; Marie Radé, carmine crimson; Felix Genere, redish rose in the centre, with silvery liliaceons reverse to the petals; Dr. Andry, brilliant red; Maurice Bernardin, deep vermilion red; Abel Grand, silvery rose; Duc de Caen, crimson purple; Victor Verdier, warm rose; Triomphe de Rennes, canary or golden yellow; Jules Margottin, crimson. I add two rather new Roses, both good growers on the Manetti (as, indeed, all the above are), which gave me great satisfaction last season: they are Edouard Morron, deep rose, and Souvenir de M. Poiteau, soft rose. As long as Roses do well I do not move them. If they do not flower, or if they produce long blind wood, root-prune or remove them. If you remove them to your semicircular mound, put the tallest in the centre, and graduate the others. In some soils Manetti-stocked Roses require to be moved biennially, or they do not bloom well in the autumn. At once remove what you mean to move, mulch them over the roots, and draw the earth over the mulching like a mool-hill. Mine are served so every winter. I lost only one Rose last winter and one this trying summer, out of 2000. I kept on two waterers for ten weeks, or I should have lost, as others have done, hundreds of my Roses. You can train your vigorous Charles Lefebvre as a pole Rose. Do not cut away altogether the lower portion; shorten the main stem one-third. Charles Lefebvre breaks chiefly from the top of the shoot; you must therefore encourage the wood that is now at the base of the plant. If you have no low furniture you had better cut the Rose down to within 12 inches of the base. The best two dark Hybrid Perpetuals for pole Roses are Empereur de Maroc and Pierre Notting.—W. F. RADCLIFFE.

WILLOW WITH CURLED LEAVES.—"Several years since I had in my garden a species of drooping Willow, in growth and size like the common Weeping Willow. It had, however, a peculiarity in regard to the leaf, the upper surface of which was of a beautiful shining dark green, the under surface being covered with a short, white, fine cottony down. These leaves were dependent, and each made two or three spiral turns, thus showing alternately a varnished green surface and a downy light one. This tree I possessed many years, but an early frost entangled in it the spray of a fountain beneath while my tree was in full foliage, thus loading the Willow with thousands of icicles, the weight of which split the tree in quarters, and utterly destroyed it. I should like to know something more of this species of Willow; perhaps some of your many readers could give me a few words of information. I should also be very glad to become a purchaser of a young plant, and so repair my loss.—C. BAILEY, *The Cliff, Chippinham*." [We think that the Willow was *Salix babylonica*, var. *crispata*. It is described, and the leaves figured, in London's "Encyclopedia of Trees and Shrubs," and in Forbes's "Salix Woburnensis."]]

HOSE SWEAGE (E. B.).—Mix the sewage with the soapuds. Pipes would convey the mixture to any part of the garden, as there is a considerable fall. A tank to which a vulcanised Indianrubber hose could be attached would probably be available.

HOT WATER NOT CIRCULATING IN PIPES (J. S. Milton).—For anything we can perceive to the contrary, the feeding cistern to your boiler is all right, and so is the flow-pipe attached to the top of your boiler; but that is of but little importance compared with having an air pipe at that

corner where you have marked the rise of the pipe as being 3 inches from the boiler, and the rest of the pipe on a level, until coming near the boiler it drops 2 feet. The first thing, therefore, to do, is to drill a hole at the highest point of your pipe, and fit there a gas pipe from one quarter to three-eighths of an inch in diameter, leaving the upper end open, and 2 or 3 feet higher than the supply cistern, and with the end bent over and downwards. This will be your great safety valve. But, secondly, in such a small house, it is easy to make the water very hot, and there must be room for expansion. Careful firing is, therefore, necessary, so as not to give the water too much heat. We would rather have more piping in a house than have limited piping over hot. You will do no good without the air-pipe. If the top end go outside the house all the better.

FIXING HOT-WATER PIPES (A Constant Reader).—On the whole, perhaps, there is no plan better than filling the joints with iron filings and salts of ammonia. If filled too tight and full the joints are apt to crack. If a base of tow or lint is used we question if anything is much better than red or white lead. With a similar base at the socket of the joint, we are sure that Portland cement will answer well if properly put on, where there is no extra heat nor pressure. We think you will find they will answer in your greenhouses. The pipes in most, if not all, the forcing houses at Woodhall, were jointed by Mr. Beales with such cement, and no pipes could be sounder nor stand better.

HOT-WATER PIPES FOR VINEY (T. H.).—We see nothing to prevent the proposed plan answering, only to have Grapes ripe in May we would not be satisfied with less than four 3-inch pipes—two as flows along the front, round the further end, and then as returns along the back. We would prefer the flows to go along the front as you propose, and the returns at the top of the raised border at back, instead of the bottom of the passage. See answers to a correspondent about having the pipes near the soil, an advantage in your case, also as to air pipes at the highest point of the pipes.

HOT-WATER PIPES ON VINE BORDER (T. H. D.).—We see no inconvenience in having your heating pipes merely the thickness of a brick above the inside Vine border. They would not heat the soil too much. They will tend to dry it, it is true, but all the better for the border filled with roots, as then you can water the often with weak clear manure water. If you would rather lessen heat in your border, and as a consequence lessen evaporation from it, place a thin board below the pipes, or common slates, painted white on the exposed surface. Were we in your case, however, we would let well alone, and just use a little more water than would otherwise be necessary.

DESTROYING WORMS ON LAWN (G. S. I.).—As you have tried lime water it is useless for us to advise that, though we think you have applied it much too weak. 12 lbs. of slacked lime to 33 gallons of water stirred well up and allowed to stand two days, and the clear liquid applied to the lawn in moist weather, the lawn being well rolled the previous evening, will mostly prove effectual. Ammoniacal liquor from the gasworks diluted with six times its volume of water will also destroy them, but has the disadvantage of making the lawn look rather bare for a time afterwards.

NAMES OF FRUITS (Cumbria).—Cox's Orange Pippin. (*H. Harpur*).—Emper Alexander. (*J. H.*).—1, Passe Colmar; 2, Red Doyenne. (*A Subscriber*).—1, Joséphine de Malines; 2, the clear of Winkfield; 3, Triomphe de Jodogne; 4, Vicar of Winkfield; 5, Doyenné Boussoch; 7, Van Mons Leon Leclere; 8, Chaumontel.

NAMES OF PLANTS (Gambetta).—1, *Salaginella apus*; 2, *Brannii* (the *S. pubescens* or *S. Willd.-novii* of gardens); 3, *S. Kraussiana* (*S. hortensis*); 4, (*E. Emera*).—*Tecoma radicans*. (*E. S. C.*).—1, *Polystichum angulare*; 2, *Cystopteris fragilis*; 3, *C. fragilis*, var. *dentata*; 4, *Athyrium Filix-femina*. (*M. R.*).—1, *Lastrea spinulosa*; 2, *L. diitata*; 3, *Adiantum hispidulum*; 4, *Nephrodium molle*; 5, *Pteris longifolia*. (*St. Kenon*).—*Eucynurus europæus*, the common Spindle tree or Prick-wood, so called because skewers are made of it.

POULTRY, BEE, AND PIGEON CHRONICLE.

THIS SEASON'S MOULT—PREVENTING PULLETS FROM LAYING.

My experience with regard to the moulting of my birds has this year been rather peculiar, several of them, both old and young, having moulted twice over. One or two Brahma hens, which moulted very well and quickly rather early in the autumn, are now in the midst of a second and much more lingering renovation, while nearly all show more or less signs of it. One or two have suffered severely, not from any complaint, but having lost many pounds in weight through the drain upon the system, they became almost like skeletons, a rather fine hen being at one time reduced to little more than 4 lbs. weight. Others, again, appear to have only gone through the usual process in an average manner; but these are chiefly hens which commenced late in the year.

Chickens, as is well known, do not experience a regular "moult" the first year, but the chicken feathers are gradually and imperceptibly exchanged for the adult plumage. This autumn, however, several, both of my pullets and cockerels, after nearly completing this normal process, are now in the midst of a regular moult, which entirely spoils them for showing. I have often found such a thing occur with early pullets which have become broody; but none of my birds were hatched before April 9th, and except one, which I sold some time since, not one has yet laid an egg. The best marked pullet I have, hatched in the middle of April, was in full plumage a month

sine, but has now about half replaced her hackle and breast-feathering, her leg-feathering also having almost disappeared. Two more are nearly in the same condition; and a very large cockerel, the largest I think I ever reared, is moulting all over the breast, fluff, hocks, and saddle, though the neck hackle is not yet grown. The flights also have nearly all dropped, and are being replaced by new ones. Another cockerel partakes of the same process, though not to such an extent, whilst the other three show no sign of it whatever.

It may be that the very hot and dry summer we had has caused the phenomenon I speak of; but as it is new to me, I should like to know whether any other readers have had a similar experience, and, if so, whether any of them have found any successful means of prevention.

I have already remarked that, with one exception, none out of a dozen pullets has laid an egg. I mention it because it is often said that there is no means of postponing the period of laying, while my experience leads me to think differently. Last year I fully satisfied myself that change of scene, combined with non-stimulating food, would postpone the period, if desired, for nearly two months, and this season I tried the experiment for the first time on all my birds. In such summers as that of 1870, a Brahma hatched in April will generally lay some time in September, or even before. About the middle of August I changed them all from one pen to another, moving each lot to a run entirely out of sight of the former one, repeating the process about every four weeks, and giving no meat nor other stimulating food. Only one has laid, though several are almost seven months and a half old; whilst last year I had pullets laying by this time which were hatched in May. I know another fancier who uses the same means with the same results, and, indeed, I believe it is no secret among experienced exhibitors; but some who may, like myself, have to gain their own experience at their own expense, may perhaps be glad of the hint.—L. WRIGHT.

TRIMMING—PRIZES, &c.

THE number of November 10th was so full of subjects of interest to us poultry lovers that it must be my excuse for inflicting rather a long epistle. So at once to Mr. L. Wright's capital communication about trimming and other deceitful practices. I must quite agree with him that his efforts have borne much fruit. Several shows have made a marked regulation about trimming and similar practices. It may be said they did this before, and this is true, only that before it was worded in such a way that the judges took little notice of it. Now I know one or two instances this year where Mr. E. Hewitt disqualified birds painted, &c., and there is certainly in the prize schedules a general tone of improvement in this respect which augurs well; but as long as we allow that in Game and Spanish art can improve nature, we are leaving a loophole for these practices in other breeds.

I may hazard the opinion that these gross cases grow upon us, and that the beginnings of the evil are small. I have at the present time a bird that I could wish would learn to paint itself on one or two feathers, but I am afraid there is no hope for this! I showed this bird as he was, and Mr. Hewitt awarded him a prize, looking, I presume, at his general goodness, and ignoring the blemish as possibly accidental, and I feel certain that with such a judge the honestly-shown bird with the blemish unaltered stands a better chance than with attempts at deception. It would be well if all exhibitors would feel this and act upon it, exhibiting their specimens without attempts at removing the foul spot. It is, however, certain that the usual washing and cleaning of some birds before exhibition makes it very difficult to draw a distinction between the removal of a soiled, half-broken, or injured feather which, I imagine, all of us would consider admissible, and the removal of a blemish or the painting over such a spot. I should much like to learn whether any exhibitor does consider this illegitimate; if so, it strikes me all washing must be given up, and then many of our specimens which are out-of-door livers would show up very indifferently, and white birds which are town-dwellers could never hope for distinction.

I quite agree with Mr. E. Hewitt, that it must be impossible to distinguish in order more than three or four pens in a closely-contested class with the present number of judges; it is amongst the highly commended pens that the great difficulty exists, where, in fact, one pen is as good as another, and not as our friend Pat remarks, "Yes, and a great deal better"—where "Caesar and Pompey are so very much alike." I do not

know that a "diploma" would be any easier matter. More prizes—there's the rub, and I for one would willingly say the first prize less in amount. The difference between first and second pens is really often nominal, the difference in prizes a reality to the tune of 50s., as at Birmingham this year. I am certain that an equalisation of prize money would meet with favour from exhibitors—I mean from "the million," if there be such a quantity amongst us. My old friend "E. M. B. A." is perfectly right in this. Silver cups are a very useful thing to dangle before exhibitors' eyes, but only a limited number get hold of them, and a fourth prize of the value of 10s. would do more to pay railway carriage than a dozen distant reflections of silver cups. During the past twelvemonth I have exhibited thirty-three pens of poultry, with, perhaps, a larger share of success than was my due, but anyway with decided success. Only four pens escaped honourable mention, and one of these was in a selling class. The railway carriage of these pens has amounted to £8. 7s. 6d., the entries to about the same amount. Taking this in round numbers, every pen I have exhibited has been at the cost of about 10s. Now, to those who have pockets, as a good friend of mine says, into which there is always a little stream of golden or silver hue flowing, this drain may be of slight importance, and may have many advantages and pleasures (irrespective of prizes), that make amends for the loss; but there are very many amongst us—I can answer for myself—who wish, with all our love for our hobby, that it should at least pay its way, and to this large class the smaller prizes are a great help. Diplomas, and embossed cards, and high commendations I personally value very much, and am often content with them, provided there is also a fair sprinkling of prize money. When, however, the dose is too frequently repeated I confess to feeling something like my poor old man Friday, who missed his slice of prize money, and honestly confessed "He could see no good in recommending them." This was always the word he employed. I am quite certain as regards myself, that 30s., 20s., and 10s., would induce me to enter a pen more than two prizes of £3 and £1. Of course, there is the honour and all that sort of thing, but I do not find that the railway people consider it any honour to convey my baskets. They spell honourable, if I may coin a word, "onerable," and charge for the burden accordingly.

Whilst on the subject of prizes, let me notice your remarks about the President's cup at Southampton. There it was offered to the best pen, and this gives a chance to the smallest exhibitor; but if, as you suggest, it is offered to the best collection, all the small exhibitors must be hopelessly out of the competition. If such a cup is necessary I think it most fair that the best pen should have it; at the same time I confess that personally I should prefer seeing the £10 given to increase the prizes generally, or to make new classes for other breeds not in the schedule. To make it open to the best collection would probably throw it into the hands of some local exhibitor who, without a fear of railway expenses, could flood the show. However, possibly in this view of the matter I may be singular.

Lastly, as regards the Crystal Palace Show, we southrons have now some reason to be proud—the prize schedule is greatly improved; in some of the classes it eclipses Birmingham, but "E. M. B. A.," in the concluding portion of his letter, notes a serious defect about the wire sides of the pens. I hope no such horrible affairs are to enclose the specimens. They entail great injury on the tails, and often actually loss of sickle feathers, and as in our protest on trimming we certainly meant also to object to re-tailing specimens which had lost this ornament, I trust the committee will carefully consider this detail of the show.—Y. B. A. Z.

IMPORTS.

	1868.	1869.
Eggs	253,969,040	412,175,040
Apples (bushels)	1,075,415	491,680
Potatoes (cwt.)	2,041,474	1,660,189

MUCH to the discredit of our countrymen is it that these imports are so large, and yet at the date of this publication new-laid eggs are 3d. each in London, and in Winchester and other country towns 2d. each.

SCOTTISH COLUMBIAN SOCIETY.—We commend the advertisement of the coming Show of this Society to our readers' attention. We have the prize list and the rules before us, and are well pleased with both—they are liberal and judicious.

There are twelve medals for Ponters, and eight medals for Carriers, as well as money prizes. Money prizes of 20s., 10s., and 5s. are offered for all the other well-known varieties, and an "Aoy other" class besides.

THE BIRMINGHAM CATTLE AND POULTRY SHOW.

THE preparations for the approaching great Exhibition in Bingley Hall are steadily progressing, with every prospect of a satisfactory result. The entries in all departments are 3130 against 2823 in 1869; an increase of more than 300. For the information of poultry fanciers, we have to announce that numerous entries of American varieties, including Dominique fowls and crested Turkeys, have been made, and that the birds are on their way to Birmingham from the United States. The roost department is expected to be unusually interesting. Besides the midland districts it will include specimens grown in localities so wide apart as Wales, the New Forest, and north of Aberdeen. The collection of potatoes will be very extensive, and in all probability exceedingly fine. The new American sorts will be well represented; as will also the Bovinia, the merits of which for feeding stock have for some time been attracting increased attention from agriculturists.

CARE OF BIRDS AT POULTRY SHOWS.

"SHROPSHIRE RECTOR" revives a painful recollection of the Hanley Show of this year's January. I sent, with other stock, a Mandarin drake, and had the misfortune to receive it home dead; nor can this be wondered at if, as "SHROPSHIRE RECTOR" says, "they were just set out in a row, on the floor of a desolate building, in the hampers in which they had travelled," &c. And although the bird might be in a tiny hamper in which it could barely move, the hamper was large enough for one Mandarin drake to travel in, it being quite 13 inches long and 10 inches wide, yet by no means large enough for the bird to be exhibited in.

On referring to my file of correspondence I find the secretary, Mr. J. B. Piercy, says, "I regret to have to inform you that your Mandarin drake was found dead in its pen this morning. I am at a loss to account for it, as the bird had been well fed and cared for." I think Mr. Piercy might have eaved himself the trouble of writing the latter part of this paragraph. How could a bird be well cared for when confined for three or four days in a small travelling hamper? I wish I had known the fact earlier, for I think I should have tried the case in the County Court for compensation. Exhibitors ought to know, before sending valuable specimens, whether or not pens will be provided; nor can there be any excuse for secretaries and committeemen not providing them, as the number required is known long before the birds arrive. Surely exhibitors have some claim upon secretaries and committees for considerate and humane treatment of their stock. It is enough to deter any one from exhibiting when such facts as these occur.—CHAS. BAKER, *Long Street, Atherstone.*

DEALERS, AMATEURS, AND PROFESSIONAL FANCIERS, AND PRIZE-HOLDERS.

In your number of the 10th inst. I see you have a brief notification of the formation of a new society, to be called the Croydon Columbarian Society. If it can be successfully and properly carried out, no doubt it will afford much amusement and instruction, and tend to elevate the theory and practice of breeding Pigeons. The officers appointed for the present, and it may be the last year if a certain rule be carried out to the meaning implied, are gentlemen eminently adapted for the purpose, but who do not seem to know how far the words, "denomination of dealers," extend. The offending rule in my opinion is, that all persons who come under the designation of "the denomination of dealers," are to be excluded as members and even visitors to the Society's Freemason-sort of meetings. I maintain that if this rule be adhered to, it is, strictly speaking, excluding two-thirds of the fanciers in this country, but I daresay the Society is not so ambitious as to require so large a number, still the proportion in the district supposed to be worked by the Society remains the same. Amateur fanciers only are allowed to become members; therefore professional fanciers are left out in the cold, in company with the despised dealers. I would ask, Where is the line to be drawn

between amateur fanciers, and dealers and professional fanciers? Take for instance any fancier who has a number or even a few Pigeons; does he not, as a rule, sell his surplus stock or exchange, or by selling realise a profit on a former purchase? A fancier who wishes to be successful must buy, sell, or exchange to the best of his advantage, and naturally enough he does not forget the pecuniary sense of the affair, and those coming under "the denomination of dealers" do no more than this. Most of your readers will know that several dealers are often selected as judges at the shows; therefore, the carrying out this rule is excluding men of knowledge that would benefit the fancy that the Society aims at improving. I do not suppose I should be wrong in using the words professional fanciers so long as others are styled amateurs; in any pursuit whenever one term is used the other is always applicable, as a distinction between the two classes. Therefore, a judge or a writer on Pigeons must be a professional fancier, and surely the former of the two, if not the latter, would be allowed to join; and if I am not mistaken, one, if not more, of the officers of the Croydon Columbarian Society have officiated as judges—certainly their authority on Pigeons is often quoted. Not wishing to occupy too much of your valuable space on this subject, I must say that this rule is wrongly worded, and if read and adhered to in its true sense of meaning, it will materially affect the prospects of a Society which might give valuable aid in popularising the breeding and management of Pigeons.

Now that I am writing, I hope a few remarks on another subject will not be transgressing too much on your columns. In looking over lists of awards and entries, I rarely see more than one of the names of, say, half a dozen of our greatest owners of prize-winning Pigeons exhibiting in one class, or in any way competing against others. As a strategic method of winning prizes it acts successfully to themselves, but does incalculable injury to the exchequer of a Pigeon exhibition. Having a somewhat large correspondence amongst fanciers, I have frequently found that a kind of timidity seizes upon a would-be exhibitor if he imagines or discovers that one of a certain few has entered in the class in which he intended to show. If these positive prize-winners could be persuaded to practise a little self-denial and refrain from showing their birds for, say, at least one season, then in my opinion new exhibitors would spring up, and hitherto-partly-successful exhibitors would combine together, and considerably augment the number of entries at different shows. The temporary retirement of these great owners might be turned to advantage, and when again they entered the field they would find more competitors to contend against, and any honours then won would be of more value. I would go further and say, that having won as they a set some thousands of prizes, it would be a feature of self-sacrifice that would cause the gratitude of other fanciers to name them saints and martyrs of the Pigeon world.—DAVID P. GOODING, *Colchester.*

THE NORTHERN COUNTIES COLUMBARIAN SOCIETY.

(From a Correspondent.)

THE first Exhibition of this promising Society was held at Belle Vue, Manchester, on the 19th inst. The classes were numerous and well represented, making allowance for the fact that members only were eligible to compete. The names of the prize-winners are sufficient demonstration of the quality of the stock exhibited, but the Trumpeters of Mr. Firth, which he exhibited not for competition, are worthy of a word of praise, though it be simply to say they were wonderfully good.

The Society is much indebted to Messrs. Peter Eden and William Smith, who awarded the prizes, and to the Messrs. Jennison for their general courtesy and good arrangements. Subjoined is the prize list.

CARRIERS—*Cocks*—1, J. B. Pinder, Harpurhey, Manchester. 2, H. Smith, Skipton. *Hens*—1, J. B. Pinder. *Young*—1, H. Smith.
PONTERS—*Cocks*—1, T. H. Ridpath, Outwood Hall, Cheadle (Yellow). 2, H. Smith (Yellow). *Hens*—1, T. H. Ridpath (Blue). 2, H. Smith (Yellow).
TUMBLERS—*Short-faced Kittles, Kites, and Self-colours*—1, T. H. Ridpath (Yellow). *Long-faced Mottles, Kittes, and Self-colours*—1, 2, and *hc*, R. Marshall, Lower Broughton. *Beards and Balbs*—1 and 2, T. H. Ridpath. *Long-faced Beards and Balbs*—1 and 2, W. Havercraft, Lower Broughton (Black Balbs). *hc*, T. H. Ridpath (Blue Balbs). *c*, R. Marshall (Blue Beards).
TRUMPETERS—1, 2, and *hc*, Capt. Heaton, Worsley, Manchester (Dun). *c*, W. Justice, Salford (Yellow). *Young*—1, W. Justice. 2, A. Mangnall, Lower Broughton. *c*, A. Mangnall (Dun).
JACOBINS—*Black*—1, 2, and *hc*, E. E. M. Royds, Greenhill, Rochdale. *c*, J. F. Pinder. *Any other colour*—1, T. H. Ridpath (Red). 2, E. E. M. Royds (Red). *hc*, T. H. Ridpath (Yellow). *c*, E. E. M. Royds (Red). *Young*—1 and 2, E. E. M. Royds (Black and Red). *hc* and *c*, T. H. Ridpath (Yellow and Red).
TERRITS—1 and 2, F. Marshall, Hatfield, Cheshire (Blue and Yellow). *hc*, T. H. Ridpath (Red). *c*, J. B. Pinder (Blue). *Young*—1, T. H. Ridpath (Red).
OWLS—*Foreign*—1, Capt. Heaton. 2, *hc*, and *c*, Major Crier (Southport).

English.—1, Capt. Henton (Silver), 2, W. Justice, *hc* and c, A. Mannall (Blue), Young (English).—1, W. Justice (Blue), 2, E. Slack, Manchester (Blue), *hc*, T. H. Ridpath.
 DRACOONS.—1 and 2, J. Holland, Manchester, *hc*, W. Justice, c, T. H. Ridpath (Yellow), Young.—1 and 2, J. Holland (Yellow), c, R. Marshall.
 FANTAILS.—1 and 2, T. H. Ridpath.
 ANTWERPS.—1, T. H. Ridpath, 2, R. Marshall, Young.—1 and 2, R. Anthonson, Manchester.
 ANY OTHER VARIETY.—1 and 2, E. E. M. Roysds (Black Swallows and Black Magpies).
 EXTRA STOCK.—1 and 2, Capt. Henton (Black Barb, Owls, and Yellow Barbs), 2, F. Mannall (6 Fantails, 1 White, 1 Blue, 1 Red, 1 Black, 1 Yellow, and 1 Silver), *hc*, E. E. M. Roysds (Bine Jacobins); A. Mannall (Dun Barb); R. Marshall (Antwerp), c, E. E. M. Roysds (Blue Magpies); R. Marshall.

IPSWICH POULTRY SHOW.

THIS, as a whole, was no doubt the best Show ever held in Ipswich, the number of pens showing an advance, and the quality of the bulk of the birds was unexceptionable.

Dorkings and *Spanish* formed very fine classes, and a pen of White Dorkings that were in open competition with Dorkings generally were such as would add credit to almost any show where White Dorkings have separate classes. The *Game* most certainly have never been shown so numerous and so well at Ipswich as on this occasion, the condition of the majority of the pens being extraordinarily good. A very considerable time was occupied by the judge in determining the cup-winners between the first-prize birds in the *Game* classes, which was valuable time wasted when so short a period of daylight remained, for it was afterwards proved that both pens were the property of Mr. Matthew, of Stowmarket. *Brahmas* were good, but the hen in the first-prize pen was much too light in the throat-feathers for a really first-rate bird, the cock being very good. Mr. Dowsett had all his own way in the Light *Brahmas*, with superior birds to those commonly met with. The only really well-conditioned pens in the Buff *Cochins* were the two pens belonging to Lady Gwydyr. Mr. Cattell, of Birmingham, however, exhibited a Buff hen that was by far the best *Cochin* of any kind in the Show, but her male companion was literally "nowhere," though the extraordinary merit of the hen earned a highly commended. The Partridge-coloured and the White *Cochins* were excellent, but scarcely monted out. *Hamburgs* were of the general quality throughout, the hen in the cup pen being the best barred on the tail we have seen for a long time past. The *French* fowls were well shown. A large entry of *Game Bantams* competed in a general class, Mr. Jeffries taking the cup for this variety. A very capital entry of *Ducks* added much to the interest of the Show.

Among the annual exhibitions at such meetings were a pair of Crested Carasows in magnificent plumage, and so tame as to be perfect pets; a pair of Rock Mynots, a very remarkable talking variety of bird; but unquestionably one of the most humorous of these oddities was a Green Parakeet, shown by J. Ransome, Esq. It amused bystanders by its words, "Ellen bring the baby," "Polly will kiss you," "Gentlemen fill your glasses," "three cheers for the Queen," "hip, hip, hurrah! hurrah!" "one more, hip hurrah!" in first-rate style.

In the *Canaries* the competition for the silver cup was very close. That exhibitors should not trust to the last available train in their dispatch of birds to a Show, is advice often given and continually forgotten; perhaps to simply detail facts and leave people to their own deductions might be more to the purpose. Upwards of four dozen pens were empty at the time of the adjudications: when any fresh baskets came during the afternoon by rail they were received and penned, if in classes not yet judged, to take their chances of success, but if in the classes where judging was already completed they were treated as empty pens. Many pens came in during the afternoon, some late in the evening, after the Show was closed for the night, and Mr. Crosland's *Game Bantams* came at nearly nine the next morning.

GAME.—*Black-breasted and other Birds.*—1 and *hc*, S. Matthew, Stowmarket (Black Red), 2, W. Raven, Ipswich (Brown Red), *hc*, H. C. Martin, Southorpe (Brown Red), Any other Variety.—1, Cup, and *hc*, S. Matthew (Duckwings and Piles), 2, W. Boyes, Beverley (Duckwings), c, W. Fenn, Ipswich (Duckwings); G. Knights, Ipswich (Duckwing).

DORKING.—1, J. Martin, Claines, Worcester, 2, O. E. Cresswell, Hanworth, *hc*, Rev. F. Tearle, Gazeley Vicarage, Newmarket; F. Parlett, Great Baddow; H. Lingwood, Barking, Needham Market, *hc*, F. Parlett, c, J. O. Fison, Stoke Hill, Ipswich; H. Lingwood.

SPANISH.—1 and Cup, Howard & Nichols, Peckham, 2, F. James, Peckham, *hc*, W. K. Bull, Newport Pagnell; H. Griss, Ipswich.

BRAHMAS.—*Dark.*—1, Horace Lingwood, Cretingham, Needham Market, 2, Lady Gwydyr, Stoke Park, Ipswich, *hc*, Horace Lingwood; Lady Gwydyr, c, Mrs. Kirkman, Woodbridge; C. Tindall, Ipswich. *Light.*—1 and 2, H. Dowsett, Pleasley, Chelmsford, *hc*, S. Pelgate, Ipswich.

COCHINS.—*Common or Buff.*—1, Cup, and 2, Lady Gwydyr, *hc*, J. Duffan, Ipswich; J. Cattell, Birmingham, *hc*, J. Boye, Northampton, Any other variety.—1 and 2, Horace Lingwood (Partridge), *hc*, H. H. Blitsoe, Barnswell, Oundle (White); H. Dowsett (White).

HAMBURGS.—*Pencilled.*—1 and Cup, W. K. Tiekner, Ipswich (Gold), 2, E. Clayton (Gold), *hc*, W. K. Tiekner (Gold); R. R. Parker, Ipswich (Gold); A. Coles, Long Sutton (Gold), *hc*, H. Marriott, Boston (Gold), Spangled.—1, W. K. Tiekner (Gold), 2, J. Wright, Melton Mowbray (Silver), c, J. F. Loversidge, Newark (Gold).

BANTAMS.—*Game.*—1, Cup, and 2, W. B. Jeffries, *hc*, Hon. Mrs. Paget, Hoxne, Sole; Rev. E. S. Tiddeman; W. B. Jeffries; J. Wright, *hc*, P. H. Jones, Fulham, c, W. H. Wallis, Frawlingham; P. H. Jones; H. P. Leach; J. Dove, Any other Variety.—1, C. Drake (Black), 2, Rev. F. Tearle (Black), *hc*, H. Dutton (Gold Sebrights); S. & R. Ashton (Black).

FRENCH FOWLS.—1, C. H. Smith, Esheridge-on-Trent (Chèvre-Cornu), 2, A. Taylor, Stansted, Norfolk (La Fische), *hc*, J. Boye, Northampton, Notting Hill (Chevre-Cornu); W. Tippler, Roxwell, Chelmsford (Houdans); Lady L. Charters, Attleborough (Houdans).

ANY OTHER VARIETY.—1 and Cup, H. Pickles, jun., Early (Polands), 2, Mason and Walker, Denton, Manchester (Black Hamburgs), *hc*, W. J. Woodhouse, West Wick, Lynn (Silver Polands).

SELLING CLASS.—*Pairs.*—1, H. Pickles, jun. (Polands), 2, Howard & Nichols

(Spanish), *hc*, Rev. F. Tearle (Black Bantams); F. Parlett (Dorkings); W. Dring, Faversham (Creve-Coeurs); Miss E. J. N. Hawker, Wyeliffe, Tisbury Wells (Silkies); J. Frost, Parham (Dorkings); Rev. E. S. Tiddeman, Childerich Vicarage (Game Bantams); Lady L. Charters (Houdans), c, Rev. F. Tearle (White Bantams); Rev. E. S. Tiddeman (Brahmas), *hc*, T. J. Salsmarsh, Chelmsford (Partridge Cochins), 2, W. B. Jeffries, Ipswich (Black Red Game Bantam), *hc*, Howard & Nichols (Spanish); W. B. Jeffries (Black Red Game Bantam); T. W. Watling, Ipswich (White Cochins), *hc*, J. Frost (Dorkings); W. Rayner (Duckwing Game); Lady Gwydyr; S. H. Stott (Dorkings); W. K. Tiekner (Golden-pencilled Hamburg).

DUCKS.—*Winn.*—1, F. Parlett, 2, Rev. G. Gilbert, *hc*, H. Dowsett; S. H. Stott, Aylesbury.—1 and 2, Lady Gwydyr, Any other Variety.—1, T. Roper, Parham (Carolina), 2, C. N. Baker, Chelsea (Carolina), *hc*, S. & R. Ashton, Mottram.

PIGEONS.
CARRIERS.—1 and *hc*, W. Massey, 2, C. H. Clarke, Nottingham, *hc*, C. H. Clarke; W. Massey (2), c, H. Yardley, Birmingham.

BARBS.—1, H. Yardley, 2, P. H. Jones, *hc*, W. Massey, Spalding.
POUTERS.—1, P. H. Jones, 2, H. Yardley, *hc*, J. A. Ransome, Ipswich.
TURTLES.—1, J. H. Brad, Cambridge, 2, P. H. Jones, *hc*, W. J. Woodhouse.
FANTAILS.—1, J. F. Loversidge, 2, P. H. Jones, *hc*, W. Massey; H. Yardley.
TRUMPETERS.—1, P. H. Jones, 2, E. Sheerman, Chelmsford, *hc*, E. M. L. Cocksedge.

TURBITS.—1, O. E. Cresswell, 2, H. Yardley.
 ANY OTHER VARIETY.—1, J. A. Ransome (Icol), 2, H. T. Frere, Burton Rectory, Doss (Yellow Dracoons), *hc*, H. Lyon, Ipswich (Carriers); W. Bird, Ipswich (Blue Owls); J. A. Ransome (Silver Antweps), *hc*, C. T. Higgins, Northampton (Blue Owls); H. Green, Ipswich (Blue Owls and Black Magpies); J. A. Ransome (Silver and Scarlet Bantam).

SELLING CLASS.—1, Sheerman (Trumpeter), 2, W. Bird (Blue Owls), *hc*, H. Yardley; T. Roper (Barbs), *hc*, H. Lyon (Silver Dun Carrier) (2); H. Green (Jacobins); A. Coles (Carriers); H. T. Frere (Yellow Beards), c, H. F. Nalder; W. Massey (Barbs).

CANARIES.
Yellow-Clear.—1 and 2, Moore & Wynne, Northampton, *hc*, T. Mann, Cambridge New Road; E. Loose, T. Fenn, c, T. Fenn, Ipswich (2); G. J. Barnesby, Derby (2), Mottled.—1 and 2, Moore & Wynne, *hc*, R. Mackley; G. J. Barnesby; T. Mann; T. Fenn; F. Gayton, c, G. J. Barnesby; T. Mann; Cockle & Watson, Mottled Crested.—1, 2, and *hc*, T. Fenn, c, G. Gayton; Moore & Wynne.
Nealy.—*Clear.*—1 and 2, Moore & Wynne, *hc*, R. Mackley, Norwich (2); G. J. Barnesby, c, T. Fenn; G. J. Barnesby (2); Cockle & Watson, Tennington St. John, Mottled.—1 and 2, Moore & Wynne, *hc*, G. J. Barnesby; T. Fenn; G. Gayton, c, R. Mackley, Mottled Crested.—1, R. Mackley, 2, T. Fenn, *hc*, R. Mackley; G. J. Barnesby; T. Fenn, c, H. Green.
LIZARD.—1, R. Mackley, 2, G. J. Barnesby, *hc*, T. Fenn; R. Mackley; Cockle & Watson, c, G. J. Barnesby; T. Fenn.
GOLDFINCH MULE.—1 and c, R. Mackley, 2, and *hc*, G. J. Barnesby.
 ANY OTHER VARIETY.—1, T. Mann (London Fancy Canary), 2, G. J. Barnesby, *hc*, R. Mackley (Linnit Mule); G. J. Barnesby; Cockle & Watson (Cinnamon), c, G. J. Barnesby; T. Fenn; G. Gayton (Cinnamon Crested).
SELLING CLASS.—1 and 2, T. Fenn, *hc*, T. Fenn; K. Loose, c, R. Loose, Stoke, Ipswich.

Mr. Edward Hewitt, of Birmingham, judged the Fowls and Pigeons; and Mr. J. Willmore, of London, the Canaries and Singing Birds.

A GREAT mistake was made by requiring all specimens to be in the Show on November 16th, before twelve o'clock. Now the Show is to take place on Thursday and Friday, the 17th and 18th, so that we at a distance of about five hundred miles have to send our birds off on the 15th to be there in time. This could easily have been avoided if 10 P.M. instead of 12 A.M. had been the hour named, so that the birds could have gone in one day's journey. I have entered for the above Show, but had I seen it sooner I most certainly should not have wasted my entry money. The birds shall remain at home, as I consider it a cruelty to send birds to stay all night in hampers, besides being without food and water. I write this merely as a caution to others situated like myself to carefully examine the rules before they send their entrance money.—GAME BANTAM.

NEWCASTLE-UPON-TYNE ORNITHOLOGICAL SOCIETY'S SHOW.

If thirty-six classes of Pigeons, with prizes of 20s. and 10s., four cups, and one gold medal will yield 443 entries, how many entries will twenty-three classes of Canaries yield, with a prize list of 10s. and 5s., four silver medals, and one copper kettle? Answer, 209. A comprehensive schedule with a liberal prize scale, is another name for a large show. Each class has its own particular admirers, and if a prize list be framed to suit all classes of exhibitors, support will come from where least anticipated, provided always there be sufficient inducement to compete. Bronze medals, laurel wreaths, and purely honorary prizes are most excellent in their way; but there is a medal bearing Her Majesty's profile which has stronger attractions. It helps to pay entry fees and railway expenses. There is something of which it is predicated in roundhand in our childhood's copybook, that it is its own reward; but poultry, Pigeon, and cage bird exhibitionising, has become so much a business, that only a favoured few can afford to compete *con amore*.

I have been among the upper walks of life—among the Pigeons. They must hold a higher place than Canaries in the show world, for they seem to me to represent a larger amount of real capital, and does not the title page of the Journal say, "Pigeons, Aviary Birds, &c.?" Don't you think it is almost that stereotyped little centrepiece were altered, and that "Canaries" became the first word of a line? Would it not

read better, "Pigeons, 'WILTSHIRE RECTOR,'" and then give Canaries and Aviary Birds a line to themselves? A little spacing-out, and a piece of "furniture" here and there would do it without destroying the symmetry of the page. Don't you think so?

Yes, I was among the Pigeons at Newcastle, and Mr. Fulton kindly went round and did all he could to lead me astray, and tempt me into his fancy. He explained the distinctive points of the different varieties in a most interesting manner; and with such apparently faultless standards of perfection before us to illustrate his lecture, he had no difficulty in pointing out what constituted a first-class and what a second-class bird. But I am afraid I was not a very apt pupil, though I can recognise a Pouter, a balloon-looking gentleman on a half brick, a Barb, a Dragoon (and you must not try to deceive me with a half-bred Carrier after Mr. Fulton's lesson), a Fantail, a Carrier, and a Trumpeter. The general appearance of the Show was very imposing, the arrangement perfect; and I am sure there was but one opinion that Mr. Blenkinsop, the Honorary Secretary, and his coadjutors are men well up in their business, and fit custodians of the reputation of Newcastle as regards the exhibition of Pigeons and cage birds. The Corn Exchange in which the Show was held covers an immense area, but the lighted gas kept it at a comfortable temperature, and not even the most delicate specimens experienced any inconvenience.

In the Canaries Mr. Rutter took all the Belgian prizes, the only specimen approximating to the quality of his being No. 452 (J. N. Harrison), a remarkably fine bird, showing true Belgian contour and "position." The silver medal for the best bird in the Belgian classes was won by No. 453, a yellow hen. Norwich were strong, Moore & Wynne taking the lion's share of prizes, and Mr. Mills the silver medal with No. 495, Evenly-marked Jonque, exhibited in faultless trim. The Glasgow Dove, the bird of Scotland, formed a prominent feature of the Show, Mr. Clark, of Newcastle, winning the medal with a remarkably neat bird. In Goldfinch Males, Mr. Young's well-known buff bird won the silver medal easily, disposing of all comers, Jonque and Mealy, including divers birds "clipped and trimmed." The Judge's opinion was duly handed in, but as I observed no intimation of the same affixed to the cages, I do not feel in a position, as reporter of a show, to mention names. I have elsewhere expressed my opinion as to what should be done in such cases, and what are the relative duties of judge and committee.

It was a cruel thing to ask any judges to decide between Mr. Spence's Brown Linnets and Mr. Stansfield's Bullfinch and Goldfinch Male. Perhaps the equal of each never was seen. Mr. Irons took the medal for the best birds among the Cinnamon, Greens, and Any variety with one of his fine Jonques, and Mr. Baxter, of Newcastle, was able to add a copper kettle to his stock of kitchen utensils through the aid of a good Goldfinch; and a fine Linnets won the silver medal for Mr. Briggs, also of "canny Newcastle." Among the Foreign Birds, a Mocking Bird, shown by Captain J. F. B. Dodds in splendid plumage, occupied much attention, and took first honours.

Judging over, I with Mr. Corker, of Croydon, one of the Judges of Pigeons; Mr. Horner, of Leeds; and Mr. Firth, of Dewsbury, both well-known successful exhibitors of Pigeons, were the guests of W. B. Van Haansbergen, Esq., who taxed the dining resources of the Union Club on our behalf in a way which they and I will not soon forget. We had already lunched with the Secretary, but hospitality appears to be one of the "rules and regulations" of the Newcastle-on-Tyne Ornithological Association.—W. A. BLAKSTON.

THERE were nearly five hundred pens of Pigeons, and of a quality never before seen at Newcastle; the liberal prize list and indefatigable exertions of the Honorary Secretary, Mr. H. O. Blenkinsop, having brought about this desirable result. The Corn Exchange in which the Exhibition was held is, perhaps, unequalled for the purpose, being convenient, capable of accommodating several hundreds of visitors, with ample room for the pens, which were all on one level, and on this occasion the temperature was well regulated by the use of numerous gas jets. Not a single mishap occurred either to the Pigeons or Canaries, and too much praise cannot be given to the attendants, who looked well after the feeding, &c., of the birds.

In Carriers, Messrs. Fulton, Massey, and Horner monopolised the prizes. Mr. Massey's birds took our fancy very much; their fresh, healthy, genuine appearance, combined with properties of head, beak, eye, and figure, render it more than probable that they may turn the

tables on their more aged and better-furnished competitors at some future shows.

In Pouters, the most noticeable birds were Mr. Fulton's Yellow, Blue, and Black cocks, and Yellow and Blue hens, all of which were excellent. We must not omit to mention the second-prize Blue cock and hen shown by local exhibitors, Messrs. Thomson & Simpson, who well merited the position they attained. The White Pouters were a fine lot, several pens being worthy of a prize.

Almond Tumblers were a show of themselves—nineteen pens, and at least fourteen very good. Mr. Blenkinsop's pair were deservedly first. The cock in this pen and that in Mr. Van's pen were the two best head-and-beak birds in the Show. Messrs. Ford, Horner, and Adams, also showed very good birds. Mr. Ford won with beautiful Black Mottles in the "other" Tumbler class. Yellow, whole feathers, were second. No other pen was good.

In the Barbs Mr. J. Firth was first with a magnificent pair of Blacks in the class of that colour. The cup in this section was awarded to this pen, the cock being unquestionably one of the very best birds of the day. Mr. Firth was also first with a good pair of young Yellow Barbs. Mr. Fielding showed a good pair of Yellows, but they were much out of condition, and Mr. Fulton had a pretty pair of Whites, the best we have seen for some time.

Foreign Owls were a good class. English Owls had a large entry, but many pens were obviously passed over.

Of Jacobins there were twenty-three entries, some of the best birds were in deep moult. The winners were good Reds. In this class several pens contained an excellent and an indifferent bird; mostly the Yellows were too coarse, excepting those of Mr. Van Haansbergen and Mr. Fulton, and both their pens were out of condition. For Jacobins of any other colour Mr. Van Haansbergen took both prizes, his Whites being the best we ever saw, his fine pair of Blacks also taking the sectional cup.

Fantails were a splendid class; five or six pens seemed almost equally good, and each worthy of a first prize. It would be very desirable to give this variety a little more room.

Trumpeters were a good class; Mr. Horner's birds the best in rose and crest, but deficient in feet and marking. Mr. J. Firth's pair took first, the cock a grand bird; Mr. Van Haansbergen was second with a splendidly bodied and rosed pair, but too light in mottle. Whites were first in the "Any other" Trumpeter class; Blacks second, both good. A novelty was shown in a pair of Reds, good in properties, but sooty in colour.

The Thrift classes contained good birds of every colour. The same may be said of the Magpies.

Nuns were a good class. Yellows, Duns, and Blacks were shown. Chequered Dragons were first in their class, Yellows second; good Blues, Yellows, and Whites also competed.

Antwerps were an average collection.

Common Tumblers were not particularly noticeable, excepting that many pens were evidently left out on account of not answering the requirements of the schedule.

The prizes for Any other variety were won by good Letz. Good Swiss were shown, and pigmy Austrian Pouters; also a pair of white birds, which looked something like a cross between a Runt and a Fantail, runtishly-made birds with short bob tails.

In the Selling class many pens were claimed.

The following is the prize list:—

CARRIERS.—Black.—Cock.—1, E. Horner, Harwood, Leeds. 2, W. Massey Spalding, *hec*, R. Fulton, Deptford, *hec*, R. Fulton; T. Colley, Walsley, Sheffield; G. J. Taylor, Earlown, Ruddersfield, *c*, F. Smith, Selley Oak, Birmingham. Hen.—1 and Cup, R. Fulton. 2, G. J. Taylor, *hec*, F. Smith, *hec*, R. Fulton; E. Horner, *c*, E. Horner. *Dun*, or *any other colour* except Black.—Cock.—1 and *c*, R. Fulton. 2, W. Massey, *hec*, G. J. Taylor. Hen.—1, J. Thompson, Bingley. 2 and *hec*, R. Fulton, *hec*, T. Colley.
POUTERS.—Blue or Black.—Cock.—1, Cup, and *hec*, R. Fulton (Black and Blue). 2, Thompson & Simpson, Widenow, Newcastle. *hec*, R. Fulton (Blue) and A. Wintour, Edinburgh (Blue) (2); E. Horner. Hen.—1 and *hec*, R. Fulton (Black). 2, Thompson & Simpson (Blue). *hec*, R. Fulton (Black); E. Horner, *c*, E. Horner. Red or Yellow.—Cock.—1 and *hec*, R. Fulton (Red and Yellow). 2, J. Walker, Newark (Red). *c*, A. Wright, Eden Side, Edinburgh (Red); W. Harvey, Sheffield (Yellow); H. Brown, Walsley, Sheffield (Red); J. Bell, Newcastle (Red). Hen.—1 and 2, R. Fulton (Yellow). *hec*, H. Brown, *hec*, A. Wright (Red); C. Vaux, F. T. Boldon, Sunderland. White.—Cock.—1, W. Harvey. 2, E. Horner, *hec*, R. Fulton (2); J. Morrison, Morning Side, Edinburgh (2). Hen.—1, E. Fulton. 2, W. Harvey; H. Cuckton, Middlesbrough; R. Fulton; J. Hawley, Bingley. *Any other Colour*.—Cock.—1, W. Moon, Edinburgh (Chequer). 2, H. Brown. *hec*, W. B. Van Haansbergen, Newcastle (Ash). *hec*, R. Fulton (Mealy). Hen.—1, J. Morrison (Chequer). 2, W. Moon, Edinburgh (Splash).
TUMBLERS.—Short-faced.—Almond.—1 and Medal, W. R. & H. O. Blenkinsop, Newcastle. 2, J. Ford, London. *hec*, E. Horner, *hec*, E. T. Dew, Weston-super-Mare; C. Vaux; H. Adams, Beverley. *Any other Colour*.—1, J. Ford (Black Mottles). 2, G. J. Taylor, *hec*, W. R. & H. O. Blenkinsop.
BARS.—Black.—1 and Cup, J. Firth, Dewsbury. 2 and *c*, R. Fulton, *hec*, R. Fulton; F. Horner. *Any other colour* except Black.—1, J. Firth. 2, R. Fulton, *hec*, J. Fielding, jun., Rochdale; W. Massey (Red); C. Vaux; J. King, Newcastle (Red).
FOLDS (Foreign).—1, R. Fulton, Fulham. 2, W. R. & H. O. Blenkinsop. *hec*, J. Fielding, jun.; P. H. Jones.
JACOBS.—Red or Yellow.—1, E. Horner. 2, N. F. Nalder, Croydon (Red), *hec*, T. C. & E. Newbitt, Epworth; R. Fulton; W. B. Van Haansbergen (Red and Yellow); W. Harvey. *Any other Colour*.—1, Cup, 2 and *hec*, W. B. Van Haansbergen (Black and White).
FANTAILS.—White.—1, R. Fulton. 2, J. F. Lovelandside, Newark-on-Trent, *hec*, E. Lovelandside; J. Walker, T. Rule, Furlham; W. R. Park, Melrose; W. Henry, Aberdeen. *Any other Colour*.—1, P. H. Jones. 2, H. Yardley.
TRUMPETERS.—Mottled.—1, J. Firth. 2, W. B. Van Haansbergen. *hec*, W. Harvey. *Any other Colour*.—1, W. H. C. Oates, Desterbore, Newark (White). 2, T. Rule, *hec*, J. Firth; W. R. & H. O. Blenkinsop.
THRIFTS.—Red or Yellow.—1, P. H. Jones. 2, J. Fielding, jun. (Red). Blue, or *any other colour*.—1, W. R. & H. O. Blenkinsop. 2, T. Rule, *hec*, E. T. Dew (Silver).

MAGPIES.—1, E. Horner. 2, P. H. Jones. *hc*, E. Horner; Miss E. Beldon, Goutaker, Pingley.
 SIBS.—1, P. H. Jones. 2, F. Graham, Birkenhead. *hc*, F. Graham; E. T. Dew.
 OWLS (English).—1, J. King. 2, A. Jackson, Heaton, Bolton-le-Moors. *hc*, J. Wilson, Darlington; E. Horner; W. Goddard, Earleton.
 DRAGONS.—1, S. N. Challoner, Newcastle. 2, A. Ashton, Parkfield, Middleton. *hc*, J. Ford; J. Watts, King's Heath, Birmingham; F. Graham (2); J. Stanley, Salford.
 ANTS.—1, J. A. Collinson. 2, E. Horner. *hc*, J. Hawley; J. Candale, Carlisle.
 TUMBLERS (Common).—1, J. Dye, Newcastle. 2, P. Stephenson, *Bald Pates*.—1, R. Grey, Gateshead. 2, R. & J. F. Baldwin, Newcastle. *Breeds*.—1, J. Dye. 2, Miss E. Beldon. *Any other Colour*.—1, W. Harvey (Stottles). 2, J. Hawley (Red Mottles). *hc*, J. A. Collinson (Red).
 ANY OTHER VARIETY.—1, W. R. Park (Lutz). 2, H. Yardley. *hc*, J. Watts; E. Horner; W. Harvey (Poreclain); W. Goddard (Black Austrian Pointers).
 SELLING CLASS.—1, J. Fairley, Edinburgh. 2, Miss E. Beldon. 3, S. N. Challoner. *hc*, N. P. Noller (Jacobins); J. Hawley; W. B. Van Haansbergen; E. Horner; W. R. & H. O. Blenkinsop; C. Anton, Jun., York.

CANARIES.

BELGIANS.—*Clear Yellow*.—1, 2, and Medal. J. Ratter, Bishopwearmouth. *hc*, J. N. Harrison, Belper. *c*, J. Baxter, Newcastle. *Clear Buff*.—1 and 2, J. Ratter. *Ticked or Variegated*.—1 and 2, J. Ratter. *c*, T. Bennett, Seaton Burn Colliery, Northumberland.
 NOAVICH.—*Clear Yellow*.—1 and 2, Moore & Wynne, Northampton. *hc*, R. Hawman. *c*, J. Briggs, Newcastle. *Clear Buff*.—1 and 2, Moore & Wynne. *Marked or Variegated*.—1 and Medal, E. Mills, Sunderland. 2 and *hc*, Moore and Wynne. *hc*, R. Hawman. *Crested Yellow or Yellow Marked*.—1, R. Hawman. 2, Moore & Wynne. *hc*, T. Irons, Northampton. *hc*, G. C. Brown, Newcastle. *c*, J. Rutter. *Crested Buff or Buff Marked*.—1, J. Young. 2 and *hc*, Moore & Wynne. *c*, J. Ratter.
 GLASSGOW DONS.—*Clear Yellow*.—1 and Medal, W. Clark, Newcastle. 2, R. Ruddick. *c*, J. Gaskins. *Clear Buff*.—1 and *hc*, (2) W. Clark. 2, J. Langhead, Kilmarnock. *Marked or Variegated*.—1, J. Baxter. 2, C. Smith. *hc*, W. Clark.
 GOLDFINCH MULES.—*Yellow*.—1, Stephens & Burton. 2 and *c*, E. Stansfield. *Buff*.—1 and Medal, J. Young, Monkwearmouth. 2 and *hc*, J. Baxter. *c*, R. Pearson, Newcastle. *Marked or Tipped*.—1, Stephens & Burton. 2, Moore & Wynne. *hc*, J. Carter, Newcastle. *c*, J. T. Dobson; J. Young.
 MULE (Any other variety).—1, E. Stansfield. 2, J. Spence, New Hendon, Sunderland. *hc*, J. Baxter. *hc*, J. Young. *c*, J. Baxter; G. Atkinson, Gateshead.
 CINNAMON.—*Jonque*.—1 and Medal, T. Irons. 2, J. Spence. *hc*, T. Irons. 3, T. Jones, Northampton (2). *c*, J. Wilson, Newcastle; E. Mills. *Buff*.—1 and *hc*, W. Gumble, Northampton. 2, T. Irons. *hc*, J. Young. 3, T. Jones. *c*, J. Spence; E. Mills. *Marked or Tipped*.—1, S. Tomes. 2, R. Hawman, Middleburgh. *hc*, Stephens & Burton. *hc*, Moore & Wynne. *c*, J. Young; S. Tomes.
 GREEN.—1, Stephens & Burton. 2, G. Atkinson. *hc*, J. & T. Dohson, Newcastle. 1, L. Billcliffe, Newcastle. *hc*, J. Eland, Newcastle; J. King. *c*, J. Carter; W. T. Mein, Newcastle.
 ANY OTHER VARIETY OF CAGE BIRD.—1, E. Mills (Golden-spangled Lizard). 2, J. N. Harrison. *c*, P. Stephenson; J. Baxter; E. Stansfield, Bradford.
 GOLDFINCH.—1, Baxter. 2, Stephens & Burton. *hc*, J. Harrison. *c*, W. Richardson, South Shields.
 LINNET (Brown).—1, J. Caprig, Newcastle. 2, J. Baxter. *hc*, J. N. Harrison.
 FOREIGN BIRDS.—1, Capt. J. F. B. Dods, Newcastle. 2, G. A. Tate, North Shields. *hc*, J. Atkinson. *c*, T. J. Pickett, Newcastle (Bishop); M. Brown, Gateshead (Austrian Parrots); P. Guthrie; W. B. Van Haansbergen; W. R. & H. O. Blenkinsop.

JUDGES.—For Pigeons: Mr. Corker, Croydon, and Mr. T. J. Charlton, Trafalgar Street, Bradford. Canaries: Mr. W. A. Blakston, Sanderland, and Mr. T. Lawrey, Gateshead.

JOHNSTONE POULTRY AND PIGEON SOCIETY.

THE third annual Exhibition and competition of poultry and Pigeons under the auspices of this Society, took place on Saturday the 12th inst., in the New Town Hall, Johnstone, Renfrewshire. The first glance round the well-filled Hall assured us that our trip to this busy town was to be amply repaid. Some grand specimens of birds in both departments at once attracted our attention, and there was only nine empty pens, owing to birds not being forwarded.

In the poultry department, Black Spanish were a small but good class; the protracted dryness of the season having retarded the moult, few birds in the west of Scotland of this class were ready for exhibition. The first and second-prize pens were particularly fine. Game were well represented, many fine and powerful birds being present. Among the *Dorkings* stood some noble massive-looking birds. But the great feature of this department was the *Humberghs*—Silver, Golden-pencilled, and Spangled. There was a fair turn-out of the old *Scottish Geys*, homely, solid, useful-looking birds; also very pretty class of *Game Bantams*, quite a show of themselves. Bantams, "Any other variety," included most of the colours bred in this class, the first prize being awarded to Mr. Yardley, Birmingham, for a pair of very handsome Golden Sebrights. Ducks, both Aylesbury and Rouen, were very fine. This department was so well judged that the awards, which we give below, speak for themselves.

The poultry were placed in large roomy pens; sides sheet iron, front, top, and back wire, giving at once plenty of light and air.

The Pigeon department surpassed last year's entries at this Show, partly in numbers, but particularly in quality. We had not crossed the doorway of the main entrance to the Hall before we were satisfied of this. A finer line of Pouters are seldom seen out of a city show than stood in this Hall. The Blues in particular were fine, many of them very valuable birds, showing not only great size and length of limb and feather, but also perfect marking. We thought the first and second prizes belonging to the same exhibitor might have been safely reversed, though, without doubt, they were very close. The best Blue Rock in the Show stood in pen 259, entered by Mr. James Butler, Glasgow, but, unfortunately, he was wretchedly matched and could have no chance. The Blacks were hardly up to the Blues in some points, particularly as to colour and length of limb. Among the "Any other colour" were many very handsomely formed and large birds. Carriers formed a splendid class; the first and second-prize birds

were very fine, but rather broad in the head. We admired the third-prize pen (young), they possessed that style and form so ably represented in Mr. Wolstenholme's celebrated portrait of this bird. Of Short-faced Tumblers there was the best class ever shown by this Society, comprising Almonds, Mottles, and Kites. Barbs were a very fine class; the first-prize pen were wonderful birds, carrying also the extra prize. Fantails formed a large class, containing many birds in most respects perfect; the true Indian type was displayed—the perfect tail, but above all, the motion. Mr. Reid, Lochwinnoch, pen No. 254, showed a cock, extra fine, but badly matched; Mr. Murdoch, Johnstone, a very fine hen, badly matched; and Mr. Sharp a pair of Black Saddles—cock perfect, but rather large. Jacobins were an extra good class; as Jacobins are generally to be seen, there seems to be too much regard paid to the colour of eye in this bird; the small, thin, swallow-shaped bird is now seldom met with. Jacobins do not seem to improve much. Common Tumblers were a pretty class, comprising Red and Black Mottles, Red and Black Baldheads, Black and Blue Beards, &c. In the "Other distinct variety" class, the first and extra prizes were carried off by a pair of those sweet little Pigeons, African Owls.

The Pigeon department was judged with great care and skill; it would have been a difficult matter for anyone to have detected a flaw.

The whole arrangements of this Show were managed with great taste and judgment, and reflect no small credit on the Committee. The weather was very fine, and the visitors numerous, rather too numerous as the day advanced.

SPANISH.—1, J. Gray, Airdrie. 2, W. Barr, Avon Braes, Hamilton. 3, J. Crawford, Scotch, Beith. *hc* and *c*, A. Robertson, Kilmarnock.

DORKINGS.—1 and Timepiece, J. Gray. 2, H. Pickles, Jun., Early, York-Lire 3, J. Malcolm, Langton, Falkirk. *hc*, D. Gellatly, Meikle. *c*, A. Grant, Jun., Kilbarclach.

GAME.—*Black or Brown Reds*.—1, J. Waddell, Airdrie Hill, Airdrie. 2, R. Arbnuckle, Parkhead, Glasgow. 3, J. Gray. *hc*, J. Gow, Kilbarclach. *c*, J. Sueddon, Linwood. *Any other Colour*.—1, J. Gray. 2, *hc* and *c*, R. Andrew, Grahamstown, Barhead. 3, D. Hurley.

HAMBURGERS.—*Golden-spangled*.—1, H. L. Horne, Whiterigg. 2, R. Tyson, Longlow, Carlisle. 3, J. Mair, Kilmarnock. *hc*, J. Sloan, Glasgow. *c*, J. Jardine, Kilmarnock. *Silver-spangled*.—1, J. Bruce, Barhead. 2, D. Gilmore, Kilmarnock. 3, A. Glen, Paisley. *hc*, J. Wilson. *c*, A. Grant, Glemtyan Mill. *Golden-pencilled*.—1 and Timepiece, S. & R. Ashton, Mottram. 2, A. Wallace, Paisley. 3, G. Calthness, Carnoustie. *hc*, W. Nelson, Johnstone. *c*, W. Bachop, Paisley. *Silver-pencilled*.—1, W. Bachop. 2, J. Sharp. 3 and *c*, H. Ayrle. *hc*, H. Colligan, M.D., Paisley.

BRAMA POOTRA or COCHIN-CHINA.—1, J. Pollock, Bushy. 2, A. Robertson, Kilmarnock. 3, A. Carswell, Turbith. *hc*, J. Carswell, Neilston. *c*, D. Gellatly, Meikle.

SCOTCH GREYS.—1 and 3, A. Grant. 2, R. Smith, Holmes. *hc*, J. Meiklem. *c*, J. Sueddon, Paisley.

BANTAMS.—*Game*.—1, J. Gray. 2 and Timepiece, J. Gow. 3, D. Johnstone, Jun., Dalry. *hc*, T. C. & E. Newbitt, Epworth. *c*, J. Sharp. *Any other Variety*.—1, H. Yardley, Birmingham. 2, A. Mitchell (Black). 3 and *c*, H. L. Horne, Whiterigg (White and Black). *hc*, J. G. Orr, Beith (Silver-faced).

DUCK.—1, J. Pollock, Bushy. 2, A. Robertson, Kilmarnock. *Any other Variety*.—1, Timepiece and 2, A. Robertson. 3, S. & R. Ashton. *hc*, J. Meiklem. *c*, S. H. Stott, Quarry Hill, Rochdale.

SELLING CLASS.—1, J. Waddell. 2, T. Jackson, Elderslie. 3, B. M. Knox. *hc*, J. Aitken, Johnstone (Silver-spangled Hamburgs). *c*, J. Gow. *Hens* (Any Breed).—1, J. Campbell, Johnstone (Black Red Game). 2, H. Pickles, Jun. 3, J. Waddell (Brown Red Game). *hc*, W. Bachop. *c*, D. Gellatly (Dorkings).

PIGEONS.

POUTERS.—*Blue*.—1, 2, and Timepiece, J. Miller, Glasgow. 3, J. Mitchell, Glasgow. *hc*, J. Sharp. *c*, W. Nelson. *Black*.—1, Miller, Glasgow. 2, W. Nelson. 3, J. Mitchell. *hc*, J. Sharp. *c*, J. Mitchell. *Any other Colour*.—1, J. Miller. 2, J. Sharp. 3, J. Mitchell. *hc*, J. Muir, Kilmarnock. *c*, W. Nelson.

CARRIERS.—1 and 2, J. Miller. 3, G. White. *hc*, H. Yardley. *c*, J. & W. Towerson, Egremont.

TUMBLERS.—*Short-faced*.—1 and 2, J. Miller. 2, J. Paton, Rigg, Stewarton. *hc*, J. Fielding, Jun., Rochdale. *c*, J. Sharp. *Common*.—1, W. Reid, Lochwinnoch. 2, J. Mackay, Glasgow. 3, J. Aitken. *hc*, J. A. Collinson, Halifax. *c*, W. Webster, Birchenhead.

BARBS.—1 and Timepiece, M. Miller, Glasgow. 2, J. Miller, Glasgow. 3, H. Yardley. *hc*, J. Fielding, Jun. *c*, G. White, Paisley.

FANTAILS.—1, J. Galt. 2 and 3, J. Sharp. *hc*, C. Murdoch, Johnstone. *c*, H. Yardley.

JACOBINS.—1, G. White. 2 and *hc*, J. Sharp. 3 and *c*, J. & W. Towerson. *COMMON*.—1, W. G. Kerr, Glenclart, Dalry. 2, 3, and *hc*, J. Sueddon, Birse Knowe, Beith. *c*, J. Galt, Kirribride.

ANY OTHER VARIETY.—1, 2, and Timepiece, J. Sharp. 3, J. Fielding, Jun. *hc*, H. Yardley. *c*, G. White, Paisley (Trumpeters).

SELLING CLASS.—1, J. Sharp. 2, T. C. & E. Newbitt. 3, G. White. *hc*, R. Blair, Johnstone. *c*, W. Genuell, Johnstone.

JUDGES.—Poultry: Mr. T. Williamson, Grangemouth; Mr. A. Paterson, Airdrie; Mr. W. Creelman, Kilmarnock; and Mr. J. Green, Glasgow. Pigeons: Mr. J. Wallace, Glasgow; and Mr. M. Stewart, Glasgow.

DRONES IN NOVEMBER.

Much as they may differ in some of their theories and conclusions respecting the economy of their favourite insect, most, if not all, bee authorities, I believe, agree in asserting that all drones are destroyed or driven forth early in the autumn of each year, frequently as soon as the middle of June. The only exception I see noticed is when a Live becomes deprived of its queen in the drone season, when the instinct of the bees demands that the drones shall, in most cases, not be expelled, but tolerated and fed as long as they will naturally exist. Having read many of the works of these bee authorities with perhaps less profit than might be expected, and fully accepted this massacre of the drones at all events as an un-

doubted fact, I was somewhat surprised to learn that drones were heard flying one day last week (the 3rd inst.), in the front of two of our stocks of black bees. These were two very strong colonies, which were eagerly taking advantage of every instant of the beautiful week which here ushered in the opening of November. Early and late they poured forth in one continuous stream, the return of which was bees laden heavily with bright yellow farina or with honey. I concluded there must be some mistake, and gave the matter no further consideration, until, on coming to open the two hives a day or so later, drones were undoubtedly in both of them.

This being to me an uncommon phenomenon, I should be glad to know if drones have been observed by others so late in the year and under similar circumstances; for I should say that the hives, when opened, showed themselves to be chokelaf of bees, with sheet after sheet of brood in all stages, a fine store of honey, apparently daily increasing, and active and laying queens. None of the conditions are here apparent that would induce a colony to keep its drones alive, and the circumstance presents to my mind one of those cases where the instinct of bees goes beyond human comprehension.—I-DRONE.

PERMANGANATE OF POTASH AS A CURE FOR FOUL BROOD.

THE disease called foul brood has long ago been banished from every stock in what I call my apiary; but that I might be able to resuscitate the plague whenever occasion demanded, I carefully laid aside a few tainted combs in a place to which bees could not possibly gain access. With these combs I inoculated a small Woodbury box in the autumn of 1869, for the purpose of observing what influence muriatic acid would exert upon collapsed larvae. The acid when poured into foul cells sensibly checked the progress of disease, but it failed to restore health.

Whilst meditating upon other agents that might be employed, a request was made to me to try a remedy which a gentleman in London had found successful in curing two of his foul stocks. To this request I at once responded, and towards the middle of December I was favoured with a small packet containing crystals, which, when used in solution, were said to be a very powerful "disinfectant and deodoriser." The instructions given were to the effect that on the infected bees being driven into an empty skep they were to be allowed a tablespoonful of the solution in a pint of syrup, and not only to be fed with it, but to be rolled in it, so that they might be literally wetted with it, both within and without. Then, after a quarantine of about twenty-four hours, the bees so treated were to be united to a healthy stock, or turned amongst healthy bees. The value of the discovery, it thus appeared, was limited to the purifying of infected bees, and as I believed that quarantine *per se* could effect this, I inquired of the author whether his prescription would not also deodorise and disinfect tainted combs and boxes. To this he replied, "I cannot be sure that the disinfectant I sent you will cure the tainted combs, not having tried it with them; but I am quite sanguine about it if care be taken, for the solution will positively disinfect any and every thing in a sanitary sense."

The solution, being permanganate of potash, was not to be despised, and I proceeded with pleasure to the preparation of hives for testing its virtue. In due course three small Woodbury boxes were contaminated with disease, and about the beginning of August last one was virulently foul, all of its combs being well filled with brood. To allow the healthy progeny to mature, and prevent any more eggs being laid, as well as to facilitate future manipulation, I removed the queen, and left the hive unopened for the next two weeks or longer. On the 29th of the month I made an inspection, and finding that the healthy brood had nearly all hatched out, I swept the bees and a young queen they had managed to rear from the combs into an empty hive. Carrying off the combs to an empty room, I, after much labour with the spoon end of tweezers, cleaned out every foul cell. The next step was to wash all the combs with the disinfectant, special care being taken that every diseased cell should be filled with it.

The saturated combs having been replaced in the box, which was also washed with the solution, attention was directed to the bees. These I gave to a clean hive containing comb and eggs but no brood, and though not purified in any way, they have not given any evidence as yet of having carried disease along with them. Into the box which received the combs

washed with the disinfectant, a strong colony with a fertile queen at the head was introduced, but care was taken first to feed and roll these new tenants in the solution minus the essence of peppermint, which I fancied might well enough be dispensed with. My disinfected hive now became an object of interest, and I was very hopeful that the permanganate of potash, from its well known and powerful qualities, would effect what apiarians so much desire to find out.

In a few days the queen had deposited several eggs, and on the 23rd of September the two centre combs were well filled with sealed brood. To see whether they would all hatch out I took the queen away, but on making an examination on October 13th one-half still remained sealed, the covers of several being flattened and perforated. On probing them the treacherous contents showed their repulsive form, and proved that the complaint, instead of having abated, had been considerably aggravated. This was a disappointment. Like the author of the cure, I was sanguine of success before I had tried it, but failure only has followed, and I am sorry for it. No one, however, need be afraid of being mastered by foul brood so long as chloride of lime in conjunction with quarantine retains its undoubted and well-attested virtue.—R. S.

APIARIAN NOTES—CAUTION AS TO BUYING SECOND SWARMS OF LIGURIANS.

THE year 1869 was singularly unfortunate as regards the success of my apiary, so much so that, although I commenced the year with five stocks, at its close I had only two. The whole of my Ligurians perished; all my attempts to multiply them by artificial means proved futile; and I only saved one natural swarm in a Woodbury straw, and a driven swarm in a Woodbury cork hive. I bought another stock in a straw hive, and so commenced this year with three stocks. We had a very long, cold winter, no warm weather until April, and the first two weeks in May were very cold, with frosty nights, the temperature falling as low as 20°. Very few showers fell during April, and the bees in my two Woodbury hives seemed very weak; the natural swarm of 1869, owing, perhaps, to the age of the queen, was the weakest.

On the 20th of May, about 2.20 p.m., my first swarm went off from the straw stock. There was a strong wind blowing at the time, and I feared the bees would be lost, as they were driven about in all directions, but they fortunately settled upon a thorn bush over the hedge, where they were protected from the wind, and although it was in a very awkward position, and not a nice one for handling, owing to the thorns, I managed to hive them safely, and in a few minutes placed them in a Woodbury hive upon their old stand, removing the stock to a new position. The swarm worked away right merrily, and in about three weeks filled the hive; and as I did not wish for a virgin swarm, I placed a super upon it, but they never worked in it, although many of them were obliged from want of room in the hive to occupy it during the night. The stock in the cork hive soon recovered itself, and, as I did not wish it to swarm, I placed a super upon it also, but with exactly the same result; no honey was ever stored in it. The natural swarm never seemed to recover from the effects of the trying winter, and had enough to do to live.

Wishing to give the Ligurians another trial, I purchased a swarm in June, thinking I should manage better with it than with buying queens; but I found after I had agreed to take a swarm, that the party advertising them in your columns only sent out second swarms, keeping all the prime swarms himself. I thought this a very doubtful matter when I received such a message; thinking first that they would not be so strong, and secondly that it would be a doubtful case whether the queen would be properly impregnated, as she would have no opportunity except during the issue of the swarm, and the odds were at least ten to one that she would not be impregnated then. I wrote to the party, and he assured me that he had had seven swarms from one Ligurian stock in 1869, and they were all strong, so much so, that he expected the seventh would swarm the first this season. That seemed to settle the first difficulty; and as to the second, I thought I could at any rate try Mrs. Tupper's scheme for securing the impregnation of queens, and so decided to have them. They arrived all right, and were a very fair swarm, and had a fine queen; but I was doubtful she was not impregnated, and as I could not see any drones I concluded she could not be. However, after searching the combs over more narrowly, I managed to find about a dozen drones,

so made a large queen cage as directed, and placed them in it along with the queen, and then put them upon the bars of the hive, where they remained the allotted time, after which they were liberated.

A day or two afterwards I was unfortunately taken ill, and could not leave my room for some weeks, and no other eye but mine could detect anything that might be wrong. The first time I could get into the garden, of course I went to look at the Ligurians, and standing a minute before the hive remarked at once, "There's something wrong here." I was too weak to examine them that day, but a day or two afterwards I went, and taking off the crown board, saw at once that my fears were but too well founded; the swarm had evidently decreased, and I could only account for that on the assumption that the queen was lost. I carefully examined every comb, but could find no queen, nor a single egg or grub; so concluded she must have gone on her wedding flight, and either been lost or killed. I immediately placed a brood comb from a black stock in the hive, and they raised a fine queen, and she proved prolific enough, but the swarm never recovered itself sufficiently to stand the winter, and so has lately been united to the next. I think this should be a caution to others not to buy second swarms of Ligurians in the expectation of thereby securing a pure strain. Many—I may say all—who have not frame hives would be quite unable to manipulate the swarm in any way on its arrival; and as I feel sure that in nine cases out of ten (if I am wrong I hope Mr. Woodbury will correct me), the queen would not be impregnated before starting, and the buyer would at best only get a stock of hybrids, and the whole affair end in vexation and disappointment.

I have united the weak stock before mentioned to the swarm of this year, and so have made up two strong stocks in Woodbury hives; and as I never like to be beaten, I have two fine imported Ligurian queens, and placed them at their head, and so hope, if spared another season, to be successful yet in establishing Ligurians in my spary. I have also the black stock in the old straw hive, which I trust will prove useful in spring, as I intend to let the Ligurians swarm and then remove the stock to the stand of the black stock, removing it to a new one, and thus multiply the Italians while I try to keep down the black race. My honey harvest only consisted of four combs (the outside ones in the Woodbury hives), but they were moderately well filled, weighing nearly 14 lbs.—J. R. J.

* Presuming the swarm to be shut up on the evening of the day of issue and despatched to its place of destination, I should say you would be right in the tenth case also.—A DEVONSHIRE BEE-KEEPER.

OUR LETTER BOX.

GREAT HORTON SHOW.—The Secretary informs us that Messrs. W. and C. Burroston's prize was the only one overlooked, and has now been paid.

AWARDS—TRIMMING (Fair Play).—Your remarks are far too personal—both parties are writing to establish truth, not merely to have the last word. We are informed that Mr. Wright purposes a rejoinder.

TURKEYS' HEADS SWOLLEN (Constant Reader).—When the weather is fine, especially if it is sunny, let the Turkeys be out a longer time. If their run be one where they can get under ricks or into out-houses, let them be out all day. Grind some oats with the barley, mix green onion tops chopped fine with them, and if you can do it, mix with milk instead of water. Wash the swelled face with cold water and vinegar, and give to the affected birds two pills of camphor night and morning, each pill the size of a horse bean. If you can separate the sick from the healthy birds you will be wise to do so.

BANTAMS DYING (F. M.).—What sort of roosting house have your Bantams? What is the nature of the flooring? If it is brick, stone, wood, or asphaltum, it is probably the cause of your birds being out of condition. If not, then the birds are suffering from severe cold or roup. Wash their faces and nostrils with cold water and vinegar. Supply them scantily with water, give them lettuce and growing grass, with plenty of fresh mould, feed only on soft food, discontinue the meat and Indian corn. Give Baily's pills. If you have them not, or till you get them, give pills of camphor night and morning, two for a dose, each the size of a garden pea. If they seem sinking, give them some bread steeped in strong ale. The floors of poultry houses must be of earth.

BLACK RED AND GRAY DUCKWING GAME CROSSING (C. W.).—The cross you mention is often used, and serves to throw much brilliancy of colour into the progeny. In silver Duckwings it adds the copper saddle. The best way to breed either Black Reds or Duckwings pure, is to breed from pure parents on both sides. There is always more certainty in Black Reds than Duckwings, because experiments such as you speak of are often tried with the latter. You are quite right in setting eggs in February, and will have no trouble in rearing the chickens.

BRAHMA MOULTING (T. F. A.).—If it is only the buckle that is at fault, and all the rest of his plumage is perfect, you may safely shoo the cock. Give him a few peas, and every evening give him a little bread steeped in strong beer.

KILLING DUCKS ANNUALLY (A. D.).—We do not think it necessary to change the Ducks every year, but we are strong advocates for fresh blood every alternate year. Your question bears on age only. It is always well to put adults of one sex with juniors of the other. The advantage of breeding from young Ducks and an older drake is that they are earlier

layers than older birds; but the first eggs of any bird are not, as a rule, preferred. We believe you may safely breed from the same Ducks two, if not three years. Change the drake every alternate year; that is all the change you require.

POULTRY-HOUSE FLOOR—NUMBER OF STOCK (P. H. S.).—We do not think you gain anything by covering the floor of your poultry house with ashes; leave it as it is, as it is of earth. You may keep a cock and six or seven hens in such a place as you describe. You must, however, provide them on a small scale with that which they would meet with on a larger run. You must give them large sods of growing grass, cut with plenty of mould adhering. They must have some bricklayers' rubbish and some road grit. Both these should be put under the roofed part of the run. You may keep Brahmas, Crève-Coeurs, Houdans, or Cochins. The first and last are good sitters, the others are not. You cannot rear chickens without a run for them. As to feeding, why do you mix bran with barley-meal? It adds only to bulk, and is about as useful as the addition of sawdust to the quarter loaf. Fowls do not like buckwheat nor oats, nor are they good food for fowls. You will do well to confine your feeding in the morning to barley or oatmeal, mixed with milk or water; soaked bread and scraps of meat at mid-day, enough for a meal, and in the evening soft food as in the morning. You must recollect potatoes do not count for much in feeding poultry.

PIGEONS, RABBITS, &c. (Rustic).—Keep both very clean, and there will be no harm. We have seen both kept in a coach-house, the Pigeons breeding in boxes above, and the Rabbits in hutches on the floor. In the doors of the coach-house were large windows of wire netting. The owner told that both did well. In our number for October 27th we figured and described in full the Barb, to which we refer you. We never recommend dealers. Buy your birds of successful exhibitors who advertise their spare stock in our columns. Buy both your birds of the same person, or you may get one bad and one good, or one of an inferior strain.

DISEASED CARRIER (R. H. Keble).—It is difficult to judge of your bird by description only. If the lump is a hard corary wart, it might be cut out and the place dressed with caustic. If it be a hot and inflamed place, we should think soothing remedies would be best, such as bathing frequently with warm water.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending November 22nd.

- 17.—Frosty fog; very fine; frosty fog.
- 18.—Densely overcast; very fine; frosty fog.
- 19.—Sharp frost; cloudy but fine; rain at night.
- 20.—Clear and fine; very fine; heavy rain.
- 21.—Overcast; showery; heavy showers.
- 22.—Fine, very damp; showery; boisterous with thunder and lightning.

COVENT GARDEN MARKET.—NOVEMBER 23.

We have very little alteration to notice; there is still a large supply of inferior goods in the market, and prices are stationary. The importation of produce from the Channel Islands, however, has much fallen off, that of Pears particularly, and they are not of the usual good quality.

From observations taken near London during the last forty-three years, the average day temperature of the week is 48.1°, and its night temperature 35.9°. The greatest heat was 62°, on the 1st, 1857; and the lowest cold 14°, on the 5th and 6th, 1844. The greatest fall of rain was 1.02 inch.

THE NEW PELARGONIUMS OF 1869.

HOWEVER much we may deplore the fact that the Pelargonium does not occupy the position in public estimation that it once did, it is, nevertheless, true that for some time the magnificent collections with which Turner, Bailey, Fraser, and others used to astonish the horticultural world have disappeared from our exhibitions. Mr. Hoyle, one of our most successful raisers, has given them up *in toto*; and the vendors of Pelar-

goniums tell us that they are not sought after as they used to be. I, whose earliest floral associations are connected with this lovely flower, cannot but deplore this, and must only hope that better times may come, and the Zonal tribe be obliged to give place to its more aristocratic relative; at present democracy carries the day. It is something, however, to be able to see that improvements are still being made in the flower, and although the usual complaint of sameness will doubtless be made concerning them as concerning others of our favourites, yet the improvement is gradual. Having had the opportunity of again growing the new varieties under my own eye, I subjoin the following notes made concerning them as they have flowered, taking first the LARGE-FLOWERING or Show section:—

Attraction.—A very pretty rosy lilac flower, quite a new colour; small maroon spot, and a clear white throat.

Bonnie Charlie.—Rosy crimson, the upper petals intense black or with a narrow edge of bright crimson; clear white throat.

Claribel.—Very pure white, with a small spot of very bright crimson. Most chaste flower, and quite distinct from other varieties in the same class.

Corsair.—Bright purple, pure white centre; top petals black, shaded. Good habit. This is also novel, and a very attractive flower.

Cycle.—Rosy purple, maroon top petals. Smooth.

Gratulation.—Rose petals, top dark crimson, with black spot, shaded; a pale rose edge.

Harold.—Crimson, pencilled lower petals; top petals black, with crimson edge. Free flowering.

Her Majesty.—A very bright pale pink flower, small black spot on the top petals, clear white eye.

Heroine.—A very beautiful flower, in the style of Mary Hoyle, small maroon spot on the top petals, orange rose edge, white centre. Good, dwarf habit.

Jerome.—Dark flower, in the style of John Hoyle; thin wiry foliage.

Llewellyn.—Rich deep crimson. Splendid colour, and a very striking flower.

Marion Wilkie.—Pale rosy pink, the same style as Her Majesty, but not so good a flower.

Maid of Honour.—Light rosy pink, small dark maroon blotch on top petals. A very fine flower, and by far the best of the pink varieties that we have.

Plantagenet.—Light rosy pink. A good flower, in the same style as the preceding, but not so fine.

Regent.—Crimson, with dark maroon top petals. A wiry habit of growth.

Velutina.—Purple, small spot on the lower petals, top black, shading to a purple edge. Bad habit.

Of these, then, I consider *Attraction*, *Bonnie Charlie*, *Claribel*, *Corsair*, *Her Majesty*, *Heroine*, *Maid of Honour*, and *Llewellyn* as the best.

The FANCIES sent out at the same time were very superior, and especially remarkable for the greater vigour of habit and the freedom of their blooming; in fact, the Fancies may now be considered almost as robust as the Show varieties.

Agrippa.—White, large pale lilac spot. A distinct and good show flower.

East Lynn.—White ground, crimson top petals, lower petals heavily marked with crimson purple, shaded; white eye.

Excelsior.—A very bright flower. Deep rose; white eye and centre. A beautifully-shaped flower.

Lady Carrington.—Soft pale peach, top petals shaded with pink; white centre.

Leopard.—A very strong grower, similar in colour to Lord of the Isles. Very good.

Marmion.—Rich crimson top petals, shaded with purple. Large and good.

Of these I should prefer *Excelsior*, *Leopard*, and *Marmion*, particularly on the point of habit.—D., Deal.

NOTES ON OUR NATIVE TREES.

WHATEVER merit the fashionable plantsman of the present day may take to himself or be accorded, there can be but one opinion, that Nature presents us with much grander objects in the magnificent trees of various kinds occasionally to be met with—trees which strike the beholder with admiration either at their size or antiquity, or perhaps both combined. It is mostly in the parks of our great landed nobility and gentry that such are to be found, with now and then a tree on some piece of common land which owed its preservation to the fact of no one having had authority to cut it.

In some of our natural forests, which, however, are now few, large trees are to be met with, and I believe the large trees in Welbeck Park are to be traced as originally forming a part of Sherwood Forest; whether those now remaining were coeval with the celebrated outlaw Robin Hood it would be difficult to say, but I believe there are authentic records of other Oaks having lived a period nearly as long. The Oak trees in Cadzow Park, adjoining Hamilton Palace, in Scotland, were, I believe, planted by royal charter some four hundred years ago, and certainly had not a more ancient look in 1865, when I saw them, than many others to be met with; neither were they such noble-looking trees as those which many parks in England contain. Some years ago a fine healthy Oak tree of large size was pointed out to me in the grounds of Earl Cowper, in Hertfordshire; it promised to be a noble specimen for centuries—it was so healthy, and it covered an immense space of ground. A still larger tree was cut down in the

park of the Marquis of Anglesey, at Beaudesert, in Staffordshire, in 1869. It contained upwards of 900 cubic feet of timber, mostly, if not all, sound. This tree was growing in the open park on ground far from what the farmer would call good, yet it had attained the size above-stated. Very fine Oak trees were also in great numbers a few years ago, and I believe are still, in the park of the Earl of Stamford and Warrington in North Cheshire. These, though not perhaps so old as some of the others I have mentioned, were excellent specimens of timber trees, and instead of being sparingly scattered about were almost too thick, portions of the park having the character of a forest. Knole Park, in Kent, is more remarkable for its Beeches than its Oaks, although both are well represented, and most other parks contain fine specimens of this noble tree. I remember some years ago measuring one in a hedge-row in Buckinghamshire upwards of 25 feet in girth, and having a fine, healthy, spreading top.

One of the most remarkable Oak trees in England, if it be still alive, and it was so twenty years ago, is the Glendale Oak in Welbeck Park, Notts. This noble tree was described by Evelyn in 1662 and measured by him, and its circumference at that time was as under:—

At 1 foot from the ground	33 feet 1 inch in diameter.
At 2 feet from the ground	28 " 5 "
At 5 feet from the ground	25 " 7 "

In 1724 this tree was hollowed out into an arch to allow a carriage to pass through it, and it became the common object of a drive for tourists and others to go through it. I expect, however, if it be still alive, that it will be taken proper care of. An engraving of it made some twenty-five years ago represented its top as very small compared with its trunk, and in all probability it may have ceased to put forth leaves, but I have not heard of its death. Other large trees are also said to adorn this park. The Great Porter is said to contain about 1300 feet of solid timber in its trunk and branches, the trunk alone containing 1100 feet. The girth of this tree at 4 feet from the ground is 27 feet 8 inches. The Little Porter, I apprehend, is smaller than its neighbour; but we are told there are other remarkably large trees in that noble park.

Beech trees of similar age to the Oaks are not uncommon, but seldom so large. I am told the Burnham Beeches, in Buckinghamshire, present a venerable appearance, but I have never had the opportunity of seeing them. Fine old trees are to be seen in the park of Sir Percival Dyke, Bart., of Lullingstone, in Kent, trees considerably more than 20 feet in circumference, I believe one as much as 25 feet. Large old trees are also met with in several parks in Hertfordshire, where Oaks are not so plentiful, the Beech being better adapted for the dry chalky soils common in those parts. Knole and Eastwell Parks, in Kent, are also remarkable for their Beeches, some avenues in the first-named park being very fine, but they have not yet assumed that antiquated appearance which the artist delights in, yet their large size promises that when that day shall arrive, there will be something magnificent to look upon.

Elms seem less enduring trees, arriving at quite as large a size as either of the others above named, but decay seems to set in at the root as soon as in the stem, and they blow down. Elms seem to take possession of the best of soil, and drive other trees from it, usurping, or nearly so, the whole to themselves, as shrubs or undergrowth seem to have a greater difficulty to maintain an existence under an Elm tree than anywhere else. Their roots also extend a long distance, and send suckers up every season in great numbers, to be cut down with the scythe if the field is a meadow, but the tree attains a great size. A timber dealer in this county once told me he cut down in East Malling Park, Kent, a tree that measured upwards of 1000 cubic feet, and was tolerably sound. It was, I believe, applied to some purpose in the Royal Navy. There are also some very large Elms in the park at Barham Court, not far distant from the park just alluded to, that are said to contain several hundred cubic feet of timber; and one in the grounds here, Linton Park, must contain upwards of 400 cubic feet, and many others are nearly as large. Nevertheless, the Elm is not a long-lived tree; rapid in its growth, and handsome in outline, especially in autumn, when its bright yellow foliage contrasts so well with the dark-coloured bark of its rugged limbs and branches, it is, however, a treacherous tree, large limbs dropping off on calm fine days without any warning. Still it must be regarded as one of the most important of our native trees.

Ash trees are, in general, more disposed to run upwards than spread, and trees with very stout trunks are not numerous; but we find now and then one of the latter class. In the

fine park of Sir Edmund Filmer, Bart., East Sutton, Kent, are several fine broad-topped trees, the circumference of the bole of one that I measured being upwards of 22 feet, but it speedily broke into branches, and the number of cubic feet it contained would not equal that of some Elms. Ash trees are prone to decay, but as an ornamental object the merits of the Ash have been unjustly decried, for when allowed fair play the outline of old specimens is very graceful, while the compound foliage and singular but handsome fruit would have more admirers, could the fact of its extreme commonness be forgotten.

Thorns, although not competing with the trees above named for size, nor utility as timber, are invariably favourites, and impart a feature of no mean importance to many parks containing good examples of other trees. A large broad-headed White Thorn in full bloom is not easily matched by anything we have, and I could point to several places where such trees form a most important item in the landscape. They are usually met with in the greatest luxuriance in dry stony places, where the subsoil is accessible to their roots for a considerable depth.—J. ROSSON.

(To be continued.)

IS ARALIA SIEBOLDI HARDY

WHEN this plant was first introduced into the country it was said to be quite hardy, but I am doubtful if it is so, for I have seen it injured by frost after having been grown for a few weeks as a cool greenhouse plant. This I know is not a fair way of proving its hardiness, but since I have been in the country I have heard more than one gardener say that it is not safe to trust it out of doors all winter without ample protection. I, and many others no doubt, would be glad to have more definite information upon this point, and if from correspondents living northwards so much the better. It will not only make a material difference in the value of the plant, but it would considerably increase its sphere of usefulness, should it prove hardy, for who would then be without the plant for the winter decoration of their gardens? Already its noble appearance, arising principally from its luxuriant growth and its large shining dark green foliage, which clothes the plant to the ground, have rendered it popular with most of those who have grown it for out-door summer decoration. It is a noble and most suitable object for planting in large vases, and possesses an advantage over many plants used for that purpose, as it stands the wind remarkably well. For sub-tropical gardens it is a very effective plant, and only requires to be more known to be appreciated.

So far I have only spoken of this beautiful plant when grown for its foliage alone, but its bloom is worth consideration. I do not think it is the least attraction the plant possesses, for even a plant from 2 to 3 feet high will throw up a pyramidal spike of flowers from 1 to 2 feet long, and as much in diameter at its base. The whole of the stem and bloom is almost a pure white, forming a very effective contrast to the dark green foliage. The plant produces fruit very freely, but I do not know what their colour is when they are ripe, nor how long they remain on the plant, as I am describing a couple of plants that are in flower at this place, and which are only now setting their fruit. These plants are planted out in the conservatory, so it is evident that my predecessor did not think them hardy enough to grow and flower out-doors as permanent specimens. I should not advise such a course to be taken unless the plant should flower early enough to get clear of winter weather, for assuredly the bloom would be destroyed, and the grower would lose a treat well worth the trouble of taking extra pains to secure. When I came here, three months ago, the plants were forming their flower buds; they soon afterwards threw up a spike and opened flowers, and have now been in bloom for some weeks. I have before this grown the plant in pots, and have found them do well in a rich loam, rather heavy but turfy, and with sand added. At this place the plants are growing in a mixture of light gitty loam, leaf mould, and rotten manure, and I think the foliage is darker in consequence.—THOS. RECORD, Hatfield Park.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 7.

DRAWING PLANS.

Fig. 29 is formed in a different manner from any of the former illustrations, so far as it is not based on any geometrical figure, such as a square, triangle, &c. It is the first in-

roduction to the way of transferring a plan from paper to the ground. Here it is transferred from one side of line *A B*, to the other side. With radius 1 *a*, draw arc *a a*; with radius 2 *b*, draw arc *b*; with radius 3 *c*, draw arc *c*; with radius 4 *d*, draw arc *d*, meeting arc *c* where the line is cut; with radius 5 *e*, draw arc *e*; and with radius 6 *f*, draw arc *f*, and *fig. A B C* is complete.

Fig. 29.

To draw a corresponding figure, it will be necessary to have recourse to other means than those employed in the formation of the foregoing examples. From the points of the bed *A B C*, as shown in *s s*, draw line *A B*, bisect line *A B*, and draw line *c D*, passing through point 1. Centre *o* is the principal point. With the dividers find the distance from centre *o* to point 1 on line *c D*, turn the dividers round and find the same distance on the other side, as point 7; from point 7, with the same radius as 1 *a*, draw *g g*, which is equal to arc *a a*. Here a pair of compasses with a pencil-leg will be necessary. Place the steel point of the compasses on centre *o*; extend the pencil-leg to point 2; place the pencil on the exact point, then turn the compasses round, and draw an arc as in point 8. Next shift the steel end of the compasses to point *c*; extend the pencil to point 2 as before, placing the pencil exactly on

end of the compasses to point *c*, and place the pencil on point 3. Remove the compasses to point *n*; with the same radius as *c 3*, draw an arc in point 9, cutting the former arc drawn from centre *o*. *D 9* is equal to *c 3*. From point 9, with radius 9 *m*, draw arc *m*. Arc *m* and *c* are equal. Find the corresponding centres to 4, 5, 6 in the same manner, and draw the corresponding arcs. When finished, *A B D* will be equal to *A B C*.

Fig. 30 is another exercise in the application of the above method of forming a complicated figure. The left-hand side of the figure, as *A C D*, is drawn without any reference to points *c* and *D*. But to draw the corresponding part, *B C D*, it is necessary to draw line *A B*, and erect the perpendicular line *n c*. Points *D* and *c* are the principal points from which the centres are taken from the left and transferred to the right-hand side, *B D C*. Put the steel end of the compasses down on point *D*; open the compasses and place the pencil on centre *I*, from which arc *c* is drawn, turn the compasses towards *a*, and draw an arc as in point *a*. Shift the steel end of the compasses to point *c*, open the compasses, and put the pencil down on centre *I* as before; turn the compasses towards *a*, and draw an arc, cutting the former one drawn from point *n*, as shown in *a*. Centre *a* is equal to centre *I*. From centre *a*, draw arc *b*, which corresponds with arc *c*. Find centres 2, 3, 4, 5, 6, 7, and 8 in the same manner, and transfer them to the right-hand side. Draw the corresponding arcs *d, e, f, g, h, k, and n*. From point *c*, draw arc *s*, uniting arcs *e c*, where the lines are cut, as in *t t*.—*M. O'DONNELL, Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

THE POTATO AND ITS CULTURE.—No. 2.
PLANTING THE GENERAL CROP.

THE time for planting cannot be exactly predetermined, and I leave it as a period to be influenced by locality, position, and season. There are great diversities of opinion as to different methods of planting, and I will briefly state two of them, and then detail the way which I consider and have proved to be the best.

Some dig the ground and plant it as they go on; when a space about a foot wide has been dug, a line is cut across, and a small trench is cast out, manure is put into the trench, and the set is placed on the manure (in some instances the manure is placed on the sets); enough ground is then dug for another row, and so on.

The second mode is to manure and dig the ground required for Potatoes, and insert the set by means of an iron-shod dibber; the holes are then covered in with a rake.

I will now narrate my own plan. In the first place, the plot of ground which is selected for the crop, if very light, will need nothing except some well-decayed manure to make it more retentive of moisture; but should the ground be stiff, mix well-chopped meadow turf, not riddled or sifted, with a little lime and leaf mould, and dig it in a full spade's depth. The sets should be whole Potatoes, about the size of a small hen's egg; the end having a cluster of small eyes should then be cut off each Potato, and those which are larger may be cut into pieces, leaving on every set not less than two eyes. In planting cast a line from one end of the ground to the other. A man should then open a hole with a small spade, or, which is better, a grafting tool, such as drainers use; a lad should then be placed in front of the man, and drop the sets into the holes as they are made, and before the spade is withdrawn, so that the withdrawal of the tool may cover the set.

When the young shoots make their appearance above ground care must be taken to keep it hoed, to subdue the weeds, and to keep the surface from caking. If the weather be very cold and wet, finely-sifted ashes may be put over the rows (just as the young shoots make their appearance above ground) in the shape of a ridge, this will facilitate the growth and protect the young plants.

All early kinds of Potatoes may be earthed-up, but late varieties do best not earthed-up, but observe they must be planted more deeply than the earlier. This is not applicable to the Potato in the field, for in many cases the soil does not run deep enough.

TAKING UP AND STORING THE PRODUCE.

The keeping of the Potato greatly depends upon the condition

Fig. 33.

the point. Shift the steel end of the compasses to point *n*. Seeing that points *D* and *c* are exactly the same distance from centre *o*, draw an arc in point 8, cutting the former arc drawn from centre *o*. Points *D* and 8, are equal to points *c* and 2. From point 8, with the same radius as 2 *b*, draw arc *k*. Arcs *k* and *b* are equal. Again place the steel end of the compasses on the centre *o*, and place the pencil in point 3; turn the compasses round, and draw an arc as in point 9. Shift the steel

of the crop when it is dug up. The tubers for keeping must be ripe. If ripe their skin will not rub off if exposed to friction, but ripeness is first shown by the haulm turning yellow, with an inclination to dry up.

The Potatoes which are intended for culinary purposes should not, after being forked up, remain on the ground any longer than to dry thoroughly, which, if the weather be fine, would not take any longer than one day. On the other hand, the Potatoes for planting should remain on the ground, placed on boards, or something of the kind, to become green and hardened—the boards prevent the tubers getting damp, which they would do if laid on the bare ground. It is indispensable to let the Potatoes be well greened, for they are then far less likely to produce a crop liable to disease.

A dry warm day should be chosen for the operation of forking up the produce. There are several ways of storing Potatoes; some have houses, others use cellars, and others pit or clamp them in the open ground; and this last is the most common mode, and not the worst—indeed, I like it the best, and I will endeavour to substantiate my preference. The Potato requires to be kept moist and cool—moist, because if allowed to get very dry it loses its flavour and firmness; cool, because if heated by fermenting in a heap it will usually become soft, and eventually decay, or will sprout unseasonably. Care must be taken, by covering the pit or clamp at least with a foot's depth of earth, to exclude cold and rain.

To secure good sound Potatoes, if the crop is large the pit should be made long, but if limited a round pit is best. Let the soil be dug out a good spit deep, lying the earth and the crumbs around the hole. Place at the bottom some dry straw, fern, or leaves, but fern is the best, and on this litter place the Potatoes in a pyramidal heap. When a sufficient quantity has been put in cover them thickly with dry litter, and on this place a coating of soil fully a foot in thickness, and well beat it with the spade, to keep it in its place and to shoot off the rain. If the pit is long and large, wisps of straw tightly bound round should be built in as the pit advances, at about 10 or 12 feet apart, and project through the earth covering—this prevents heating; if the pit is round one wisp will be sufficient.

In storing Potatoes for seed, I have always found it best to pack the Potatoes in straw, both at the bottom and on the top, placing them on a stone or plaster floor, in any position where there is a current of air passing underneath. The Potatoes must be watched, and if inclined to shoot or sprout they must be laid out thinner, and in no case should the sproutings be rubbed off, for if they are watched, and the tubers laid thinly, they will not advance sufficiently to require removing, and instead of throwing out long, weak shoots, stiff, healthy, shoots will be produced.—J. C. LEWIS, *Gardener and Bailiff, Sudbury Rectory, Derby.*

FRUIT TREES FOR SMALL GARDENS.—No. 3.

After planting, bush and pyramidal fruit trees certainly require more attention than standards, for they will need summer pruning, and top-dressings of manure; but whilst the annual attention and labour will be greater, there is an ample compensation in the greater and earlier produce of bush and pyramid, as compared with standard trees. I need not further dilate on the advantages of growing fruit on pyramids and bushes, but will close these papers with a few hints on the varieties to cultivate.

I must thank Mr. Rivers for his short article in reply to my request for a list of fruit trees suitable by their productiveness and good quality for small gardens. The selection given at page 322, by Mr. Rivers, I consider excellent in every respect, good bearers, and good in quality. I have grown in the west most of the kinds named by Mr. Rivers, and many of them have I seen doing well at a considerable elevation in Wales on the hillsides o'er which Yvel Yamma flows. I was particularly anxious to have his advice on this subject, because he could bring to bear an amount of experience which few or none of the fruit growers of this or any country possess; and secondly, he, as a nurseryman, has opportunities of testing a far greater number of varieties than most fruit cultivators in private establishments; also he has experience in a more southerly situation than I have been. My experience has been north of the Humber and a line drawn straight across to the Irish Sea. Now, I am in the north-east corner of North Yorkshire, about 300 feet above the sea, and perhaps three miles from it as the crow flies, exposed to its full effects when the wind blows from the east. South, and to a great extent west-

ward, there are miles of moor. What succeeds here will do so almost anywhere. I must, however, state, we are well sheltered to the north by plantations.

PEARS.—1, Williams's Bon Chrétien does well, being very prolific, large, and good; end of September. 2, Beurré Giffard, forms a tree-growing pyramid, fruit medium size; beginning of September. 3, Bergamotte Esperen, extraordinarily prolific, medium size; February onwards. 4, Beurré Hardy, vigorous pyramid, fruit large; beginning of November. 5, Alexandre Lumière, good bearer, medium size; November this year, but generally December and later. 6, Fondante d'Automne, medium size; October. 7, Beurré d'Areberg, prolific, medium sized; beginning of November this year, generally December. 8, Seckle, small, great bearer; October. 9, Beurré Diel, large, prolific; November. 10, Marie Louise, large; October and November. 11, Zéphirin Grégoire, medium size, great bearer; December and January. 12, Comte de Lamy, medium size, good bearer; October.

These are all very hardy, fine, and healthy both in tree and fruit. Passe Colmer bears abundantly, but the fruit is small; November. But for (than any for growth and fruiting is Beurré de Capiaumont, yet it is not of first-rate quality; October. Louise Bonne of Jersey is very prolific, but the fruit is small and much pitted. Against a wooden fence (open trellis), it was excellent; October. Etienne de Mello, good bearer, fruit small; November. Beurré d'Anjou, Winter Nolis, and Beurré Superfin generally bear well, and are pitted. Beurré Bachelier, large, good bearer; December. Beurré d'Amanlis, large; September. Joséphine de Malines is a great bearer and good; February. The last three I would add to the first twelve, but I have no pyramid trees of them. I have found they generally succeed in the north. I might extend the list by noting some that occasionally do well, but from the uncertainty I think it well to leave them unnoticed.

APPLES.—*Kitchen*—1, Lord Safford, very large; October and November. 2, Cox's Pomona, large; December. 3, Dumelow's Seedling, large; December to March. 4, Northern Greening, large; December to April; 5, Gooseberry Apple, large; December to beyond May. 6, Rymer, large; December to April. Those six I can confidently recommend as the best for a cold or, indeed, any climate, as kitchen Apples, either for private use or growing for sale. 7, Norfolk Bearer, large; December to February. 8, New Hartborden, large; December and January. 9, Keswick Codlin, good for jelly, and the best early kitchen Apple. 10, Tower of Glamis, large; November to February; 11, Blenheim Pippin, or Orange, large; November to February. 12, Winter M-jeting, large; November to March. The above are all good kitchen Apples, great and certain bearers. Apples, in my opinion, are best as bushes, especially those with large fruits, as all the kitchen Apples should be, and as the preceding are.

Dessert.—1, Cox's Orange Pippin, medium-sized, very handsome; November to January. 2, Early Harvest, medium-sized; August. 3, Kerry Pippin, medium-sized; October. 4, Kedleston Pippin, small; December to March. 5, Red Astrachan, medium-sized; September. 6, Scarlet Nonpareil, medium-sized; January to April. 7, Sturmer Pippin, medium-sized; January to May. 8, Melon Apple, medium-sized; December to February. 9, Mannington's Pearmain, medium-sized; November to March. 10, Reinette du Canada, large; March to May. 11, Nonpareil, Old, medium; April. 12, Pitmaston Nonpareil, medium-sized; December to February.

Desert Apples having, as a rule, smaller fruit than kitchen Apples, are better adapted for pyramids. I ought to name Margil, medium-size, as a good bearer; November. It has a smack of the Ribston flavour. Court-Pendü-Plat, medium-sized, January to April, is excellent.

PLUMS—*Kitchen*—1, Early Orleans, red; end of August. 2, Oullin's Golden, yellow; early in September; very vigorous, a marvel of productiveness. 3, Prince Eaglebert, purple, large; September. 4, Early Prolific (Rivers's), purple; beginning of August. 5, Autumn Comète, red, large; not unlike Victoria, but later. 6, Yellow Magnum Bonum, large; end of September. 7, Damsou, Cluster or Prolific, bears profusely as a pyramid. 8, Victoria, red, large; end of September.

All the preceding are good kitchen Plums.

Dessert—1, July Green Gage, medium-sized, greenish yellow; August. 2, Belgian Purple, rather large, purple; end of August and beginning of September. 3, Jefferson, large, yellow; September. 4, Green Gage; September. 5, Kirke's, large, purple; end of September. 6, Angelina Burdett, medium-sized, purple; September.

These are all good bearers, but the fruit does not attain a high degree of excellence, yet is good. Transparent Gage does not ripen, nor does Coe's Golden Drop; and Reine Claude de Bayar cracks and splits up into all kinds of forms, besides not ripening. In some sheltered situations in the north they may do. Where they will, they should have a place, for they are most excellent.

CHERRIES.—Kentish, medium-sized; Morello, large. These two are for kitchen purposes. The trees are very prolific as pyramids. Archduke, later by ten days than May Duke, bush; Empress Eugénie, large, ten days earlier than May Duke; May Duke; Transparent. These are all of the Duke race. Bigarreau, and Bigarreau Napoleon, of the Bigarreau race; Werder's Early Black, and Governor Wood, one of the Hearts. The last eight are good bearers, and dessert fruit.

For those that have only room for a very few trees, I give a selection of three of each—viz., *Pears*: Williams's Bon Chrétien, Beurri Hardy, and Zébulin G'égoire, or if a late one, Bergamotte Esperen. *Kitchen Apples*: Lord Suffield, Cox's Pomona, Damelow's Seedling. *Dessert Apples*: Early Harvest, Cox's Orange Pippin, Pitmaston Nonpareil. *Kitchen Plums*: Early Prohibe (Rivers's), Prince Englebert, Oalhn's Golden. *Dessert Plums*: July Green Gage, Belgian Purple, Jefferson. *Cherries*: Empress Eugénie, May Duke, Archduke; and Kentish for tarts.

The Pears should be on the Quince stock, the Apples on the English Paradise stock, and the Cherries on the Mahaleb or Cerasus Mahaleb.—G. ARREY.

A HORTICULTURAL SOCIETY FOR ULSTER.

It is in the great manufacturing centres of England and Scotland that horticultural exhibitions are most appreciated and successful, and horticultural science finds its most devoted and enthusiastic votaries. It was, therefore, anomalous and not at all flattering to such a city as Belfast to be without an established institution of that kind, and that its efforts hitherto in this direction should be merely spasmodic and intermittent. It is pleasant to record the fact of energetic measures being now taken to remove the reproach. During the present year a movement was instituted, and a two-days exhibition, on a large scale, held in the Belfast Botanic Garden, in the first week in September. Though on that occasion the second day was far from favourable, the affair was a success, and encouraged the promoters to go a step further, and establish a North of Ireland Horticultural Society, with the view—as the prospectus now before us states—of promoting “the pursuit of horticulture in all its branches, in every part of the province, and in some degree (since its exhibitions will be open to exhibitors from every quarter) in every part of the island, and even of the United Kingdom, and among every class of people.” With this object, it is proposed to hold exhibitions every year in Belfast, “not fewer than two, nor more than three,” at which prizes shall be given for every description of garden produce, and at each of which special prizes will be offered for specimens grown by cottagers and artisans.

This last is an important point as regards a town like Belfast, where, among its operative classes, one should look for the same horticultural enthusiasm as exists among the “stockingers” of Nottingham. We trust the new society will make its influence widely felt in this direction. It is evidently the intention of the Committee that this should be the case, for they tell us there is nothing which they “look upon as more desirable or more really beneficial to the community at large than to encourage a taste for gardening among the classes who depend on daily wages, and who in this way, it is hoped, may be led to find a healthy employment for their hours of recreation, and to take an honest pride in the embellishment and comfort of their homes.” The young Society hopes one day to be able to extend its operations beyond Belfast, and in course of time, if the funds permit, to be able either to hold exhibitions in other towns which may wish it to do so, or to aid those exhibitions which are already established, by subscribing to their funds or by giving additional prizes at them.

His Excellency the Lord Lieutenant has kindly consented to be the patron of the Society, and, with characteristic liberality, he further gives a cup, value ten guineas, which will be competed for at the first show, to be held in the Royal Botanic Gardens, Belfast, on Thursday, May 18th, 1871. It will be remembered that his Excellency also gave a cup of the same value to be competed for at the show held last September. The schedule of prizes for the first or May show, next year, is already issued; and from a copy now before us we are glad to perceive the prizes are

sufficiently liberal to tempt some of our metropolitan exhibitors to a trial of skill with our northern friends. Grapes, Peaches, and Pine Apples are, at all events, portable enough; and for two bunches of the first-named the first prize is £3, the second £1 10s.; for Peaches, £2 and £1; and the same for Pine Apples. Four new plants sent out since January 1st, 1870, are not likely to be over-large—nay, perhaps they would go in a very small space; and yet for such a class the spirited proprietor of the *Belfast News-Letter*, J. H. Henderson, Esq., J.P., offers a cup value five guineas, with a second prize of two sovereigns.

Copies of the schedule, as well as of the regulations for the exhibitions, may be had on application to Mr. J. F. Johnson, Botanic Gardens, Belfast; or C. D. Yonge, Esq., Honorary Secretary, Notting Hill, Belfast. It is, we believe, to the latter gentleman, who is no less enthusiastic a horticulturist than he is distinguished as a scholar, that horticulture in Belfast owes in a great measure the impetus and, thus far, the carrying to a successful issue of the movement for establishing on a firm basis the North of Ireland Horticultural Society, and thus wiping away what has been so long something very like a reproach to the good taste and spirit of the metropolis of Ulster.—(*Irish Farmer's Gazette*)

LABELS FOR FRUIT TREES.

A CORRESPONDENT, “C. C. E.” (page 350), takes exception to the method of labelling fruit trees advocated in page 329. He believes “chemical action takes place between the label and the wire, besides the harder edge of the zinc cutting the softer lead wire, so that in twelve months all his labels were on the ground.” Now, I believe, and I have studied chemistry a little, that all the chemical action incited between a zinc label and a lead wire never could have cut through the latter in the short space of a year, if at all, especially as the inciting fluid could seldom have been more potent than rain, and even that only occasionally. Had the chemical action been referred to the zinc label and the copper wire, I should more readily have trusted in his belief, as these are the very metals most generally used to induce chemical action, or, I may say more appropriately, galvanic action.

But gum and canker are referred to the use of these labels. Now, pomologists allege that the latter is caused by tap-roots striking deeply into cold crusty soil, and producing soft unripened wood, which has its tissue ruptured by intervening frosts, and consequently canker is the result. At the same time I will not deny that cutting the bark of stone fruit trees will produce gumming, if the labels be hung on loosely, but that branch only on which the label is hung will be so affected. But why allow the bark to be cut at all? A little attention acts as a preventive. Punch a sufficiently large hole in your label, and use thick lead wire for very obvious reasons. Pass the wire through the hole, give it a twist or two to make it tight, then encircle a branch near the stem, or a smaller one near a main branch, with the two ends, which twist round each other till they clasp the branch pretty firmly; then bend the label close to the stem or main branch, where the wire, soft and easily manipulated though it be, is yet quite strong enough to keep it, and prevent its being “a sport of winds and the ruin of the bark.” As the wood and bark are seen to swell slacken the wire a little, so as to prevent the bark from cutting, and the remedy for a time is complete.

The above method is not new. It has been recommended to me by an uncle, a gardener by profession, a most successful and intelligent pomologist as well as floriculturist, who applied it for years without evil results.

“C. C. E.” is now using a strip of lead stamped with the number which corresponds to the particular tree in his orchard book: allow me to suggest to him the stamping of the name instead of the number. A set of letters will, no doubt, cost more than a set of numbers, but consider the gain to pomological learning that may thus ensue. Who has not felt the disappointment of examining a tally to learn the name of a plant, and finding only a number? Let fruit-growers adopt any plan they please, but with all earnestness let me say to them, Attach names to your fruit trees.—A. R.

NAPOLEON'S FLOWER.—The Violet is the emblematic flower of the Buonapartes, as the Lily is of the Bourbons. When Eugénie agreed to accept Napoleon's offer of marriage, she expressed it only by appearing one evening dressed in an exquisite Violet toilet—Violet in her hair, in her dress, even to a branch

in her hand. Louis Napoleon understood, and it was his only answer. Napoleon while consul selected this as his flower. It was through Josephine asking him to bring her a bouquet of them on her birthday—a desire he was only able to serve after very great difficulty. He cultivated them assiduously while a prisoner at St. Helena; and they were profusely planted over the grave of Josephine. After his death his coffin was covered with the humble flowers he loved. It is even said that in the earlier days of Louis Napoleon, he was silently made acquainted with who his secret friends were, by a cautious display of Violets.

THE ROYAL BERKSHIRE ROOT SHOW.

The twenty-first Exhibition of roots, annually held in Reading, and which is now generally known as the Royal Berkshire Root Show, took place on the 26th ult. in Messrs. Sutton's large stores in the Market-place. This Exhibition is conducted at the expense, and under the management of Messrs. Sutton & Sons. The competition is not confined to the immediate district of Reading, but is open to all comers; and from England, Scotland, Wales, and Ireland, we here find brought together such a collection of roots, that the Show may fairly be termed extraordinary when the unusually dry summer is taken into consideration. The number of entries this year exceed those of any other, being nearly 400 against 270 in 1869, and 250 in 1868. There are also very fine collections of Turnips, Kohl Rabi, Carrots, Cabbage, and Potatoes; among the latter we noticed the Bovinia or Cattle-Feeder, and Suttons' Red-skin Flour Ball, of extraordinary size and fine quality. The following is a list of awards for roots cultivated in gardens:—

12 Parsnips, R. W. Hall Dare, Esq., Newtownbarry, Ireland; 2nd, Mr. B. Lane.

12 Red Carrots, Messrs. Virgo & Son; 2nd, J. Bates, Esq.

12 Reading Onions, Mr. Thomas Naschy, Banbury; 2nd, Mr. J. Cave, Rickmanworth.

24 Kidney Potatoes, P. McKinlay, Esq. (Early Rose); 2nd, John Bates, Esq. (King's).

24 Round Potatoes, F. G. Jones, Esq., Bala (Suttons' Red-skinned Flour Ball); 2nd, the Reading Union.

Extra Prize, for collection of seedling Potatoes, Mrs. Betsy M. Paterson, Dundee.

The Judges were Messrs. Wilkins (Mortimer), J. B. Spearing, and Jenkin Davies, whose decisions appeared to give general satisfaction.

We understand that some of the finest specimens will be exhibited on Messrs. Sutton's stand at the Smithfield Club Cattle Show.

THE LAW OF FASCIATION AND ITS RELATION TO SEX IN PLANTS.

[Read before the American Association for the Advancement of Science.]

At the last meeting of the Association Dr. Sterry Hunt handed me a fasciated branch of *Picea balsamea*, in which the branchlets of the fascicle presented a very distinct appearance from the normal form. In the language of the person who directed Dr. Hunt's attention to it, it seemed as if a Norway Spruce was being developed from the Balsam Fir. From facts I had previously observed, and embodied in my paper on Adnation in Coniferae, read at Chicago, it was clear that these branchlets did not possess the adnating power which I showed in that paper to be characteristic of the highest vigour. The leaves were not distichous, but scattered around the weak stems, terete, and in every respect like those on plants in the young seedling state; and corresponding in this character with the free leaves in *Arbor Vita*, *Juniper*, and similar plants, when the branches are forced to grow in shady places, or under other conditions unfavourable to perfect nutrition. I was astonished at the suggestion that fasciation could possibly be a weakness of development; because, though very little has been written about this phenomenon, all that I have read refers to over-nutrition as the probable cause. I believe I can now offer some facts which will show that there may be two distinct causes of fasciation—one an abundant supply of nutrition, which consolidates together parts normally free, as we often see in *Asparagus*, *Plantains*, *Dandelions*, and other common things; the other a weakened flow of vitality, which is not able to combine parts together, which usually go to make up the integrate structure, and which then take the form known among the people generally as "Crow's-nest branches."

That the last cause was probable in the case before me, I saw, as I have already stated. I found several specimens on living trees of Balsam Firs near me similar to the one given to me by Dr. Hunt, and watched them frequently. That they were weak developments was clear from the fact that they made little more than an inch of growth every year—that the leaves, usually of a dark green, were of a paler hue—they were destroyed by the first frosts of autumn, becoming as deciduous

as the Larch, while the regular leaves continued evergreen—and many of the fasciated shoots died during the course of the winter. The pale tint was evidence of defective nutrition, as it is well known to every practical gardener that when, from any cause, the fibres of a plant become injured, and the free supply of sap is from any cause, as by ringing the bark, cut off from the leaves, they become of a pale sickly hue. It was also evident from the inability of the fascicle to keep its leaf green, and some of its branchlets alive during winter, that vitality was at a low stage.

I examined the fasciated branches on other kinds of trees, and found these general results in all; but in none so well illustrated as in a *Sassafras* tree, which had nearly all of its branches in this condition, one of which I exhibit. Another tree was alongside of it quite free from this character. The one with the fasciated branches was not nearly as large as the other, although there appeared no reason in soil or other circumstances why it should not be. A great number of the branchlets in the fascicles also died out every winter.

I was very anxious to find how these fasciated branches would behave in a state of inflorescence, but could not find any case of one bearing flowers. At length I discovered them in the common Blackberry, *Rubus villosus*, and was pleased to find that they not only confirmed the view I had taken of the cause of this kind of fasciation, but also furnished in the most unexpected manner new facts in favour of my theory of last year respecting sex—namely, that the male is the offspring of a declining vitality. These fasciated branches in *Rubus* I am inclined to think common, and it will be very easy to verify the following facts:—In these fasciated branches the number of branchlets varies from five to fifteen.

The pale tint characteristic of failing nutrition is particularly marked, while the lower leaves die away earlier than in those branches on the same cane produced in the regular way. That the whole of these leaves will fall first I anticipate, but cannot speak from actual knowledge. Here are perfect evidences of failure of nutrition, decreased vitality, and fasciation all going along together.

Now in its relation to sex. I pointed out in my paper on this subject last year, that the flower-bearing parts of plants were weak in proportion as they diverged from the feminine condition. In a polygamous plant the pistillate flower is on the stoutest axis—the hermaphrodite the next—the male the weakest. So also in the grades of masculine weakness. When the male flowers had their stamens reduced to petals, the plant or axis of the plant was weaker than before; and when the sepals took on the character of leaves, or the leaves lost their chlorophyllous character and simulated petals, vitality was well known to horticulturists to be in a weaker state than in other cases.

Here are the same illustrations. As you see in this specimen, the lower branches, pushing in the usual way, have the regular calyx segments; but in the upper set of fasciated ones the segments have taken on a leaf-like form, the stamens have increased in size, and the pistils, as shown by the great number in some flowers which have failed to swell out their ovaries, are proportionately defective. A tendency to masculinity is clearly in connection with defective nutrition, decreased vitality, and fasciation.

I saw this, however, still more clearly demonstrated in a field of a cultivated variety of Blackberry—the *Wilson's Early*, on the farm of Mr. W. Parry, of Cinnaminson, New Jersey. His son Levi, an intelligent and observing young man, called my attention to the fact that wherever these fascicles occurred the flowers were nearly double, and no fruit followed. I found this to be the case so far as the flowers were concerned. In some there were as many as twenty petals, and the calyx segments were largely foliaceous. There could not be clearer illustrations of masculinity and fasciation going along together.

Returning to fasciations of the "Crow's-nest" kind, we may then safely say that they are bundles of branches formed from germs, which, if nutrition had been sufficient to provide the required vitality, would have adnated together and formed one vigorous united axis, instead of as now, each struggling on in its own weak way. I am aware that this conclusion may conflict with received theories as to the formation of axis or stem. It would seem to imply that one perfect branch is but a collection of smaller homogenous ones. I sometimes see cases which indicate that this may be so. I have here a portion of a cane of *Rubus occidentalis*. At the base it is no thicker than the average of other canes; but near the middle of its length it has separated into four smaller canes. It has been usual to

regard these cases as the result of an easy and accidental union of several points; but in this case there is no increase in bulk—nothing but clear assumption to warrant any such a theory. On the contrary, every appearance suggests, not that the union of branches is the accident, but that that is the normal condition; and that it is the division into the fasciated branchlets which is the departure from the rule.

I do not, however, wish to ask for this suggestion anything more than it may be worth. Others more able than I can interpret the circumstances. The main object I have had in this paper, is to show that all the circumstances which accompany fasciation are those connected with a low stage of vitality. On this I think there can be no mistake.—THOMAS MEEHAN.

[At the conclusion of the reading, Mr. Meehan said that as he had already observed in the paper, he had not been able to find fasciated bunches with flowers, except in *Rubus*, so as to draw many facts from sex as to the causes of fasciation. But while with the excursion of the Society to Albany the day before, he had found a plant of *Atriplex rosea* with a fasciated branch. He exhibited this specimen, and showed that it had eight branchlets from the fasciae and all had male flowers only, while each of the other branches of the plant bore male and female flowers, separate, and according to the law he had already pointed out in his paper on sex—namely, with the male flowers on the weakest axes, and the female on the stronger ones.]—(*American Gardener's Monthly*.)

We lately were shown a very remarkable example of a fasciated stem of the *Tropæolum majus*. It was about a yard long, fasciated throughout, and sprinkled over with diminutive leaves. It grew in the garden of Capt. Hall, Notting Hill, Kensington Park.—EDS.]

KEEPING ICE.

I THINK there are many disappointed in the keeping of ice as well as "G. Y. M.," for I have the supplying of a large establishment through the summer, autumn, and winter. I think the way I manage my ice houses may be of interest to some of the readers of this Journal, for I met with many disappointments till I hit on the present way of managing it.

I have two houses in the shrubbery close to the lake, where the sunshine never intrudes. It is completely enclosed with large trees. My largest house is 20 feet deep by 15 wide at the top, gradually narrowing to the bottom. My other house is not quite so large; it is 15 feet by 9. This smaller house does not keep the ice nearly so long as the larger one—the larger the stack the longer it keeps. In filling the houses I make a large stack in the shade close by, which lasts till July. Generally when the ice is an inch thick I set to work, have it well broken on the bank, then put it in the houses, and have it very heavily malleted inside, using large mallets of about a stone weight each, thus forcing it very firmly together. Then I pour some boiling water on it, which makes it unite very well into a mass. I pour on the boiling water about ten times during the filling of one house. I find straw a very bad cover for ice. I have also tried sawdust, but I prefer clean dry leaves. Of course too much of leaves must not be put on, so as to cause heating. I put on about 3 inches thick all over the stack, then I add a little more in the summer to keep it cool. If it be freezing after filling the houses, I leave the doors open, and put nothing over the ice till the frost is gone.

By thus managing I have still plenty of ice in the larger house. I never cover up the doorway, but by shutting it closely there is just room left for the foul air to pass away. I need to have it latched, and then when I opened it there was a steam or vapour in the house, which caused the ice to melt very fast. By this management I am able to supply two barrows daily, and have enough to last till next February. The ice always melts from the sides a little, but it is in such a hard block that it requires a crowbar to loosen it. By making a large stack outside it prevents the need of opening the houses, except to see how they are going on, till July.—E. E.

[We consider these results of practice very reasonable, as frost and ice may be expected ere long. Beginners may compare them with the note at page 415. Too much strew cannot be laid on having ice houses and ice heaps of a good size. One thing we do not understand—using boiling water to consolidate the ice. When the ice is very hard and thick in severe frost, and therefore difficult to pound, watering with ordinary water would be an advantage. Lately our ice was too slushy to need watering. It may be the most scientific mode to use boiling

water, though we do not see why and how. We gave up using salt for consolidating ice, because we saw it proved of little or no benefit, though to this day the general reasons assigned are rather more puzzling to us than the use of boiling water.]

MUSHROOM-HOUSE MANAGEMENT.

We have had recently to depend on our open shed, and have gone on very fairly. We have thrown some stable dung into a heap, watering when necessary, and will turn it several times to have it rather sweet, to form the first piece of a bed in our Mushroom house. As the house is getting out of order, we are putting in fresh-sparred wooden platforms. Where platforms are used, brick, stone, and slate are better than board, but oak and even 1½-inch deal last a long time. With all the attendant steam we think our last beds lasted about fifteen years, and a good many of the uprights and bearers were sound even then. In a low house, wide enough to have a bed 4 or 5 feet in breadth on each side, it is the most economical mode to have no platforms. In the winter months, however, if anything, our platform-beds generally succeed best. Of course, if there is a bed coming on below, the bed above it has the benefit of the heat, and nothing suits the Mushroom better than the moist heat from decomposing rather sweet dung, and without the dung in some shape we can do little with the Mushroom.

There are two drawbacks to the free use of this moist heat in a Mushroom house. If the roof is not very smooth and airtight, the moisture will act upon it, and cause it to decay prematurely. Then, again, the moisture condensed on the roof—and that moisture, if from dung, not always clear and sweet—is apt to drip on the Mushrooms and rather injure their colour. This could to a great extent be remedied by having ventilators placed at the highest point in lantern fashion; but then whatever the Mushroom may delight-in in the open pasture, it does not like keen draughts under cultivation. The chief antidote for both these evils is to have a smooth-plastered ceiling, and then to paint that ceiling when dry with boiled oil, or oil with some anti-corrosion paint, not enough to make the ceiling at all rough. The moisture that condenses against the ceiling will have no chance to penetrate the plaster, and the drops, instead of falling on the beds, will run down the smooth ceiling to the side wall.

In our practice and observation we have met with a good many instances in which roofs of Mushroom houses nicely plastered have fallen piece by piece over the beds, because damp had acted on the plaster, and thence extended to and rotted the laths and rafters. It is sixteen or eighteen years since the ceiling of the roof of our lean-to house was brushed over with oil, and though it has looked rather dingy ever since, we believe that the roof is perfectly sound.

As stated above, our house is just a close lean-to shed behind a vinery, with a common 9-inch wall, a small brick ventilator at each end at the apex, and ventilation also in the outside wall. We have often had good Mushrooms in that house all the year round, but frequently in very hot weather in summer they would be thin, and would be soon attacked by maggots in spite of everything we could do, and very likely just when we wanted them to be particularly good. This led us years ago chiefly to depend for a summer supply on small beds in a shady shed, open on one side to the west. Here they gave good returns, and with little trouble. All sorts of places are used successfully for growing Mushrooms. For doing so all the year round, no place is better than a deep cool cellar, a cavern, or any place under ground, where a rather equable mild temperature is maintained all through the season. There is hardly any great advantage, however, which has not its counter-veiling disadvantage, as in the cellar, the cavern, &c., there is some trouble in taking the dung down and back again—more trouble than when a barrow can do all that is wanted. A correspondent wants a neat Mushroom house, that must be built in rather an exposed place, but so that company may go into it summer and winter. We would rather like some shade, and have a prejudice for a lean-to roof facing the north; yet we would not greatly object to an open position and a span-roof facing east and west, or even south and north, if deemed more suitable, provided we were allowed to have double walls, a double roof, and a confined body of air between such walls and roofs, so that even the ventilation should have no access to that confined air. Then, by painting or otherwise rendering the outside walls and roof as white as possible, we should have

a house that would never be very warm in summer or very cold in winter. In such a house artificial heat would be little needed, still it is a help when quick returns are wanted at times, and if the house were from 12 to 14 feet wide there would be room for a bed on each side, and a path of 3 feet wide in the centre, and that pathway of stone, slate, or gravel, could have a hot-water pipe on each side of it. If in the house one or two platforms should be deemed necessary, then to be in character the uprights and bearers should be of iron, and the bottoms and sides of slate. The house would always look neat, except when a bed was being made, and when shallow beds are used this might be too often to prevent, except to the interested, a Mushroom house being a show house.

Some small windows would be necessary, if merely for light, so that visitors should see the crops; the windows, too, had better be double, otherwise they might admit too much heat in summer. The question of light is rather too large as respects the Mushroom to be entered on here, farther than to state our conviction that Mushrooms grow as well in the dark as in the light, and that so grown they are as firm, sweet, and healthy, as those exposed to free light and air. We have no objection whatever to the light if it do not interfere with the desirable equal temperature; but no one need be afraid to use Mushroom-houses that never were exposed to a direct beam of light. With the requisite temperature of from about 70° in the bed, and from 55° to 60° in the atmosphere over it, even ventilation is of very little consequence, except to get rid of superfluous vapour when a new bed is being formed. It is in a close, muggy, warm night that the Mushroom grows most rapidly out of doors, and we can hardly err to take a lesson from Nature to guide us in our practice. It will only be by doing so that we shall succeed in cultivating other valuable fungi.—R. F.

ESSAYS ON FLORAL CRITICISM.—The prize offered by Lieut.-Col. Scott, R.E., Secretary to the Royal Horticultural Society, for the best Essay on Floral Criticism, has been awarded to Mr. Alfred Bradley, 8, Salisbury Road, Highgate Hill.

THE AMERICAN PEACH TRADE.

THE *New York Times* says, that in the season "every man, woman, and child luxuriates at a small expense in the most delicious fruit known to humanity." But the Peach of the southern counties of England is superior to the American, and Covent Garden Peaches are from four to eight and ten times as large as Washington market Peaches. New York draws its supply chiefly from Delaware, Maryland, and part of Pennsylvania. Most of the fruit is sent by railroad in through cars; in favourable weather it arrives in much better condition by water, but weather cannot be relied on. The supply which reached New York and Philadelphia last year exceeded four million baskets, a basket averaging 200 Peaches; but this year there is hardly half a crop, owing to an "eastern blight." The method of the Peach trade in New York in the season is this:—A trip to Jersey City about 1 A.M. will show a shabby-looking unwashed crowd awaiting the cars. As soon as they arrive, no time is lost in selling, and 100 000 baskets are gobbled up very quickly, in quantities varying from 50 to 500 baskets at a time, by middle men. Now comes the turn of the first-class retailers, who often spend 3 dols. to 5 dols. a basket for choice lots; then the grocers, a hard lot to nit, but good buyers, make a large hole in a consignment; after them come the apple women, pretty hard at driving a bargain, but profitable customers in the main. The shippers and preservers come in later, and generally get fruit cheap. The last customer is the worst—the huckster. Be Peaches ever so good or ever so rotten, he hides his time, and never misses a chance of pouncing on some unfortunate dealer mad with anger at being "stuck," and anxious to get back some of his money. Rarely, however, does this class of retailers get anything but the very worst article, or pay more than 75 cents. a basket for it. When it is considered, that on

a moderate computation there are over 10 000,000 dols. embarked in the Eastern Peach trade, the profit on which exceeds 35,000 dols. per annum to the growers, labourers, and mechanics of the region, nearly 250 000 dols. per annum to the New York commission houses, 1,400,000 dols. to the railroad and freight companies, and perhaps another 3 000,000 to the vendors in New York, an idea of the importance of the trade may be had.—(*American Gardener's Monthly*.)

FRUIT TREES FOR SMALL GARDENS.

THOUGH much obliged to Mr. Abbey for his articles on the above subject, I was glad to see the editorial comment on his calculations of prices and productiveness, for an acre of such trees as he refers to have never given me anything at all approaching to the return he would lead one to expect. What with frost and drought, winds and weevils, the £ s. d. of fact is a very different thing from the £ s. d. of theory; and Mr. Abbey will add much to his favours if he will say whether his conclusions have been arrived at by actual experiment with a strict cash account, or whether they are merely an inference from his great general knowledge of fruit culture.

Mr. Abbey certainly has a large margin in his estimated cost of trees—viz., Apples at 1s. 6d. each; for many large firms—for instance, Fisher & Holmes, of Sheffield, supply splendid trees at 5s. per dozen; and I am told by market gardeners that some firms offer their maiden plants at 2d. each; and even that price, a grower informs me, affords a good profit, the land being £6 per acre.

I have no desire to throw cold water on bush fruit-tree culture, quite the reverse; it is a source of increasing interest and pleasure; but cent. per cent. at the end of seven years is a result I have never seen nor expect to see; and if an income of £180 per annum could be educed so pleasantly from an acre of land in seven years, men would not so freely risk their necks in grubbing for diamonds at the Cape.—C. C. E.

CHATSWORTH.—No. 1.

GLORIOUS Chatsworth! the crown and pride of Derbyshire, the best and most enduring memorial of the genius of Sir Joseph Paxton, is one of those rare places where harmony of aspect everywhere prevails. The wide expanse of the park, which in its circumference of eleven miles embraces more of natural beauty than can be found in almost any other county, the lofty mountain from whose summit the hillside comes down with a majestic sweep into the valley, through which the bright Derwent has its course—now gliding smoothly along, and now brawling over beautiful cascades, its waters agitated by the masses of rock over which it descends seething and foaming with a pleasing cadence—the gentle eminences, and the magnificent trees—all these features are in fine keeping with the princely mansion, which occupies an important position overlooking much of the fine scenery surrounding it.

But it is to the gardens I must turn my attention, as belonging more to my peculiar province, and which are so worthy of the great master whose hand designed their principal features. From the grand conservatory down to the kitchen garden all is on a scale of magnificence, and every part is enriched with the choicest treasures of the vegetable kingdom. Many are the striking features which the gardens generally, and the pleasure grounds particularly present; each of these features is on so vast a scale that it is developed in the highest degree of excellence. Here noble deciduous trees display the full beauty of their magnificent proportions, and vast spreading branches sweep the closely-mown turf, and in grounds so extensive and so beautifully kept they have an air of dignity and refinement very different from that which they present when crowded together in groups or shut in among thickets of wild underwood.

The masses of rocks forming the rockery are so disposed as to cause one to fancy they are the result of some terrible convulsion of Nature; so boldly and wildly are they arranged, that it seems hardly possible that the hand of man could have scattered these mighty fragments with as much ease as though they were so many pebbles. These rocks occupy a considerable space, at some places standing out boldly in all the might of their rugged majesty, and at others partly concealed among the shrubs with which they are interspersed, and as walks wind among them one is enabled to thoroughly enjoy this curious

and interesting scene. Close by the rocks, near an immense block, so carefully balanced that a slight push causes it to revolve on its centre, is the model of a tree called the Weeping Willow, standing in a circular enclosure with a narrow entrance. This tree is undoubtedly more worthy of its name than any natural specimen, for by turning a valve it is made to shed a copious shower of water, as many an unwary tourist has discovered.

The grand conservatory is a magnificent structure, covering an acre of ground; it is 277 feet long by 123 wide, and the central transept is 67 feet high with a span of 70 feet. It is heated by hot water, which traverses six miles of pipes, and to these statistics may be added the interesting fact that upwards of 70,000 feet of glass were used in glazing the roofs. Entering from the north end under an elegant Grecian portico, a sight of rare magnificence presents itself. Along each side of the central walk there are Palms growing in all the wild freedom of Nature, with wide-spreading frondage, light, elegant, and exquisitely graceful; some, as in *Corypha australis*, springing from the ground, while others, as in *Corypha umbraclifera*, borne aloft on stems so smooth and hard as to appear more like columns of stone than living trunks. At one part of the building we come upon an avenue of Bananas so luxuriant as to quite shut in the path along each side of which they are growing; their great leaves bend gracefully, high overhead, so that one can enjoy the full beauty of their delicate texture, and fancy oneself really strolling in a tropical jungle, the huge vegetation of which probably attains as high a development here, and a more exquisite finish than it does in its native habitat; for here no winds obtain the mastery and lacerate this splendid mass of foliage, which, from its large size, must be peculiarly susceptible of injury, especially when so violently agitated as it must be by the terrific storms which at times rage near the equator. At another part is a thicket of Bamboo (*Bambusa arundinacea*), then one of Sugar Cane, Cinnamon trees, and *Papyrus antiquorum*, the Paper Plant of the ancients.

At one corner of the building a singular effect is produced by a group of Aloes with their spinous leaves of the deepest shade of green, and on the opposite side to these quaint-looking plants is a splendid fernery formed of rocks, among which grow in the wildest luxuriance a host of the most beautiful varieties of exotic Ferns. Steps winding among the rocks give access to the gallery which runs round the building, so that the Ferns may be closely inspected, and their full beauty thoroughly appreciated. Very different is the aspect of such a fernery from that of the ordinary Fern house with its formal flat stages and with the Ferns growing in pots. I do not, of course, suppose it to be possible for many gardens to have such a huge and costly mass of material for such a purpose, but surely it might be modified in such a way as to suit the capacity of the smallest house. I lay some stress upon this, because there can be no doubt that when Ferns are cultivated in so natural a manner they are not only more luxuriant in growth, but much more beautiful in appearance than they can ever be in pots, however well they may be arranged.

From the gallery we have a fine view of this splendid collection of tropical plants displaying themselves in all their varied beauty of form and colour—the elegant forms of the foliage gracefully springing up and mingling together so charmingly that each leaf serves to draw attention to its neighbour. The vast extent of the building, and the immense number of choice plants spread about it so lavishly, produce an effect of incomparable grace and magnificence.

Such a sight might very well content one, even if there were no other objects of interest to be seen, but this is merely one among many others, of which the fine span-roofed Orchid houses worthily rank high. The whole of the Orchids were in the finest order and condition. In the cool house, besides the Orchids, was a fine collection of *Sarracenia*s, *S. purpurea* and *psittacina* being especially good. The *Dendrobium*s were also very fine, as were some remarkable pans of *Miltonia spectabilis*, *Clowesii*, and *virginialis* in fine flower. Of other plants in this house worthy of notice I may select a fine *Lycaste Skinneri*, *Cologyna cristata* very fine, *Calanthe vestita*, *Calanthe Wallichi*, and beautiful plants of those fine Ferns *Gymnogramma peruviana* and *Gleichenia semivestita*. In the Mexican house were splendid pans of *Cattleya crispera superba*, a very fine *Vanda teres*, *Dendrobium densiflorum*, and a very good *Lomaria gibba*. This is one of the most popular of Ferns, and it certainly deserves its high position, for it is extremely useful.

In the East Indian house my attention was at once attracted

by the magnificent collection of *Vandas*; many of them must be fully 6 feet high, and all of them were in fine health. Another striking object in this house was a noble plant of *Nepenthes Rafflesiana*. The *Aërides* were also very fine, especially a beautiful plant of *snaviissimum* in flower; nor must I omit a *Platanopsis Schilleriana*, a *Calanthe Veitchii*, and a grand *Anthurium cordifolium*. I have named only very few specimens out of this splendid collection, but the whole of them were in a high state of health, and their cleanliness and beautiful arrangement betokened the exercise of great care and skill in their culture.

Of another range of four span-roofed houses, two contained *Azaleas*, another some flourishing *Heaths* and *Epacris*e, and the fourth a fine collection of stove plants. Here was an enormous *Eucharis amazonica* 5 feet in diameter, a striking plant of the dark-leaved *Dracena ferrea*, and a fine *Alsophila exalca*.

The plants in three other stoves were all in a creditable condition, but none of them call for special mention, excepting a magnificent plant of *Maranta Veitchii*, by far the finest specimen of it that I have seen.

A long corridor or glass case leading up to these houses was very interesting from the fine climbing plants clothing the back wall throughout its length. Many large plants of *Fuchsia*s were trained up the wall, with *Tea Roses*, *Azaleas*, *Acacias*, *Veronicas*, *Bruceansias*, *Solanum Capsicastrum*, *Clianthus puniceus*, *Camellias*, and such plants as *Eutaxia myrtifolia*, *Chorozems cordatum*, *Mimosa prostrata*, and a very fine *Citrus decumana* (the *Shaddock*), laden with large fruit. A novel and striking effect is produced halfway along the corridor, where there is an alcove in the back wall, on each side of which is a large plant of *Camellia reticulata*, and the alcove itself contains a magnificent *Camellia alba plena*, which, though it grows against the wall, does not present a flat surface like the others, but is so trained that the centre of the plant stands out some distance from the wall, and from this raised centre the branches are beautifully graduated backwards to the sides, which are close to the wall. High overhead a beautiful fringe of the flowers of *Fuchsia corymbiflora* hung pendant along the top of the alcove.

The orangery is 108 feet long and 27 wide—it is an apartment of *Chatsworth House*; it contains some fine *Orange* trees, many of which originally belonged to the collection of the *Empress Joséphine*, at *Malmaison*. A pair of huge white *Camellias* nearly 20 feet high, had beautiful healthy foliage and an abundance of flower-buds. Some very large *Rhododendrons*, a fine *Lomaria gibba*, a lofty *Asplenium fontanum*, a *Phyllocladus trichomanoides*, with its singular pendulous branches and many fine pyramidal *Camellias*, are the principal plants. Among the plants I noticed a beautiful marble copy of the *Medicean vase*, and a charming group of statuary of *Venus* and *Cupid* at play; but these sink into insignificance as one obtains a glimpse of the magnificent art treasures in the sculpture gallery, which opens into the orangery. Here are marble figures possessing all the graceful symmetry which the hands of such masters as *Canova*, *Gibson*, *Campbell*, *Schadow*, and many other famous artists could impart, and in the centre of the gallery is an immense vase of polished granite, known as the *Mecklenburgh vase*, which was cut out of a single block, and is 20 feet in circumference.

A broad flight of steps leads down from the orangery to a gravel walk, whence other steps ascend to the *Camellia* house. On each side of this walk was a broad ribbon border of nine rows arranged in the following order—1, *Cerastium tomentosum*; 2, blue *Lobelia*; 3, Golden *Pyrethrum*; 4, *Iresine Herbstitii*; 5, Flower of the Day *Pelargonium*; 6, *Pelargonium Christine*; 7, *Stella*; 8, *Cineraria maritima*; and 9, a purple *Pentstemon*. These were two very handsome borders. The plants were in full beauty, and the arrangement most satisfactory, with the exception of Flower of the Day, for which I would substitute Flower of Spring. One was puzzled at a little distance off to know what the *Pentstemon* could be, for its rich deep colour was very peculiar and attractive; it was just high enough to form a capital back row.

The principal masses of flowers are displayed in a series of raised beds with stone facings, which have a fine effect viewed from the terrace walk along the west front. The style of colouring was massive and very effective. The appearance of the whole of the beds was altogether good, for these raised beds seemed to me to possess an air of dignity very suitable for the important position they occupy; and what, perhaps, helps as much as anything to impart this is that they are so far apart that each is a complete and finished feature in itself.

Their large size, too, and the ample breadth of turf on which they stand, all add to their importance.

I must not conclude this part of my report without alluding to the renowned Emperor Fountain. From the south front a

fine vista opens out between masses of lofty trees to some of the hills in the distance; in the centre of the space between the trees up springs this noble fountain, a single jet of 260 feet high forming a glistening cone of falling spray, depending on

Conservatory at Chatsworth.

no statuary nor architectural accessories to add to its effect, but by its grand simplicity and mighty force alone it dazzles

and astonishes all who see it.—EDWARD LUCKHURST, *Old Lands, Buxted, Sussex.*

NEW BOOK.

Sea-side Walks of a Naturalist with his Children. By the Rev. W. HOUGHTON, &c. Groombridge & Sons.

THIS is one of that very useful class of books—popularly written yet accurate—composed by men of science who could write authoritatively on its deep things, yet who can descend to write alluringly for the young, like Faraday, who in the morning was tearing compounds into their elements by the galvanic power, and in the evening rivetting the attention of children by lecturing on a candle. One extract illustrative of Mr. Houghton's style must suffice:—

“‘Papa,’ said May, ‘there are some large stones near the water; do you not think we might find some Sea Anemones attached to these stones?’ Off we all scamper, and Jack very soon tells us he has discovered what he thinks must be a Sea-Anemone. At once I recognise the animal as a specimen of the common Smooth Anemone (*Actinia mesembryanthemum*); we will wait by this large stone and examine the creature. It is fixed by its broad fleshy base to this bit of rock, its numerous tentacles spread out in the little pool the tide has left; the

mouth is situated in the centre of the disc. I dare say we can tempt the creature to use it for our instruction. I will catch a small fish and offer it to the Anemone. See the tentacles have caught hold of it, and are bringing it to its mouth; in about two minutes the fish is swallowed.”

“Here is another Sea Anemone, a much finer specimen than the one Jack found. ‘Oh,’ said May, ‘it is a beautiful specimen; is it the same species?’ It is generally considered to be a variety of the other one; it is called the Strawberry Anemone, from its resemblance to the fruit of that name. If I touch its tentacles, it immediately closes itself up. These creatures have no eyes, yet are so susceptible of light, that they will often show they are aware of a passing cloud by shrinking. Should an unlucky crab, though stronger far apparently and much more active than the zoophyte, touch the expanded arms, activity and strength avail it little; with slow, but pertinacious and unflinching grasp, the *Actinia seizes* hold of it,

and soon involving all its limbs with the tentacula around the mouth, the victim is gradually dragged into the polyp's stomach, there to perish. All its softer parts, all that can be nutritious, is digested and dissolved, until at length the Actinia, being satisfied with its abundant meal, opens again its mouth, and then regurgitates the shell and what is indigestible. Nor does a little food suffice to satisfy its appetite. The Actinia is voracious, harmless and flower-like though it seems; sometimes, for instance, it will swallow whole three or four mussels for a breakfast, and dissolve them all except the shells. Mr. Gosse calls this species the 'beadlet,' from its possessing a number of blue bead-like tubercles around its mouth. The scientific name of Actinia is from a Greek word, meaning 'a ray,' in allusion to the tentacles. This is a very variable species as to colour, and the commonest of all the Sea Anemone family. The Actiniae resemble their relatives the Hydræ, in their power of reproducing lost portions of their bodies. If

one be cut in two with a sharp knife or razor, each half will grow to a whole animal."

We wish to arouse more attention to the marine aquarium, and, therefore, will republish the following which appeared in our columns about twelve years since:—

"In the subjoined cut are represented four of the best Sea Anemones, whether for a beginner or an adept. In the richest collection the common 'Mes,' or *Actinia mesembryanthemum*, is as valuable as the rarest, on account of its intrinsic beauty; and as to hardiness and longevity, no creature of the deep ever yet brought within domesticating influences, can equal it. When all goes wrong, and the pretty creatures drop from their stony pinnacles and perish;—when the water gets putrid, and, perhaps, half a dozen degrees of specific gravity too dense—'Mes' will still be found alive and unhurt, and will display its coral fingers and bright blue beads the moment he is lifted into a purer element. This is known by many popular names, of

which the most common is 'Strawberry Anemone,' for the most plentiful form of it is that which strongly resembles, when closed, a well-grown Sir Harry. But it has so many varieties, that for mere effect this species is, in itself, sufficient for a small tank. In its most common form it is spotted on a crimson ground, Strawberry fashion; in another it is of a deep maroon, without spots. There is another variety of a deep quiet chestnut; another of a dark olive green, and a rarer and exquisitely beautiful one of a very bright, almost grass green.

"The numbers on the cut refer to the specimens as follows:

—1, 2, 3, *Sagartia anguicomma*, or snaky-locked Anemone, in three different states, the last being shrunk up; 4, *Bunodes clavata* in its ordinary force of expansion; 5, the common 'Mes' expanded, and closed; the row of heads resembling torquises which surrounds the tentacles, is peculiar to this species, and adds vastly to its beauty, especially in the rose and coral-coloured specimens; 7, *Actinia bellis*, the sea Daisy; 8, the lovely red *Alga*, *Delesseria sanguinea*, drawn from a very fine specimen; the plant on the other side is *Furcellaria fastigiata*; 6, one of the few purple *Alge* that may be preserved in small collections."

WORK FOR THE WEEK.

KITCHEN GARDEN.

VARIOUS are the schemes of rotation practised by different gardeners, many of them being based on no better foundation than the convenience of the hour; where, however, the kitchen garden is sufficiently extensive, and where much produce is required, the rotation of crops should be carefully studied. Calendrical limits will not permit me to offer more than a few words of advice, which, however, will, as far as they go, be a tolerably safe guide. The great difficulty is to procure fresh ground for the Cabbage tribe, so numerous are the kinds as well as successions in cultivation. Broken-up plantations of Strawberries, Raspberries, and bush fruit, with Celery ground, should at all times, as a leading principle, be set apart for some of the Cabbage family. The ground from which Celery has been grown, especially in the Scotch or bed fashion, is also

ready-made ground for new Asparagus beds. Potatoes prepare well for almost every crop. Deep or tap-rooted crops should be succeeded by shallow or fibrous-rooted ones. When the course of cropping has been decided on for the ensuing year, and duly entered with numbers in the garden book, the practice is to set up laths opposite to the space appropriated to each crop, with the number corresponding with the book, and the name of the crop on one side, and on the other the manure, where from, and the quantity, with the mode of cultivation—digging or trenching. This done, a labourer who can read the label can set out or proceed with the work at any spare time. Winter has at last commenced, and it behoves every one possessing a garden to cast his eyes once more round in order to see whether its rigours can be further softened with regard to anything tender. An opportunity will now occur of covering

the roots of *Asparagus* with a good coat of the best rotten manure. Hard frosts frequently do serious injury to this root from want of such covering. The Celery ground, as before observed, will answer well for a new plantation; it should be ridged to mellow as the crop is taken up. Cover *Endive* plants with a slate or tile laid on each side, and cover the whole with dry leaves, finishing with some stable litter; in this way they will blanch well and be fit for use throughout the winter. The best policy with *Lettuces* intended for supply next spring is to allow them to freeze tolerably firmly before covering them up. A very light screen of straw should be shaken over them at first, and when this is frozen add a little more, the object being to keep them frozen as long as possible; above all, do not uncover them when a thaw arrives; let them remain until completely thawed. These remarks will bear equally on all other vegetables of a tender character. On dry, well-drained ground on a south aspect, a sowing of Peas may now be made. The Double-Blossomed Early Frame is the most profitable for this purpose; Prince Albert is earlier, but is apt to suffer much from cold winds and wet, and succeeds better when started in heat and transplanted in February. Where there are not pits adapted for forcing *Sea-kale* and *Rhubarb*, let a quantity of each be covered over with pots or wooden boxes, or hooped over with rods, and have fermenting material placed round them—leaves are preferable to any other, and by covering them with some long stable dung, they are prevented from being blown about the garden. It is beneficial to water the soil in which the plants to be forced are growing with water heated to 130°, covering the ground immediately with leaves.

FRUIT GARDEN.

Fig trees must now have some dry Fern or Spruce boughs nailed over them to prevent injury from severe frost, though damage is less likely to occur this season, as, from the fine warm summer we have had, the wood of every description of tree is well ripened, and consequently will resist the effects of severe weather with impunity, whereas, if ill-matured it would suffer severely. If I dared to prophesy I should say that next season would be more than usually abundant in fruit of all sorts.

FLOWER GARDEN.

The late slight frosts will have brought vegetation generally to a state of inactivity, and finally destroyed the lingering floral beauty of the declining year. Let, therefore, the clearing-off of the decaying stems be at once proceeded with, as also the general removal of the fallen leaves. In this uncertain climate it is all-important to have a reserve of protecting material at hand in case of need, but it is best not to apply it till there be some indications of severe weather. If we protect carefully and the season prove mild and growing we may do harm. Complete all planting, and forward all alterations, particularly the removal of objectionable trees, which, if cut down now, may be taken away in frosty mornings without much damage to the turf and walks. Now that the flowers have departed it will be necessary to endeavour to compensate for their absence by the perfect order and neatness of the surface of the garden, the gravel, the turf, and the soil. It is advisable to keep all Carnations and Pinks which may have been potted during the past month from the action of frost, as they are unable to withstand it so well as those which have established themselves from being potted earlier in the season. They should not, however, be shut down when damp, for though extremely hardy, no flower suffers so much from want of a free circulation of air as the Carnation. Tulip beds, as a matter of course, have been covered as previously directed. The lesson taught to florists generally last season will not soon be forgotten, and from the loss then sustained I anticipate greater attention will be paid to protection for the future. It is a good plan to place young shoots of Gorse between the rows of Pinks where rabbits are apt to come, and it will prevent cats from taking liberties with the beds, independently of protecting the plants from the cutting winds of the winter months. Look well to the turning of compost heaps, &c.

GREENHOUSE AND CONSERVATORY.

The Camellias will now be making a fine display in the conservatory; they should receive careful attention as to watering with very weak tepid liquid manure. Let them not, however, receive a drop until they are really dry, and then supply them liberally. If in such cases any air bubbles arise, continue to fill up with water until they cease. Let not a drop of water bespilled on the conservatory floor at this period, and keep on a very little air at back all night in order to let atmospheric humidity pass off.

Be very cautious in the use of fire heat, the less the better if 45° to 50° can be secured. In the greenhouse, see that the early-flowering Cinerarias have the lightest place in the house, close to the glass; crowding is very prejudicial to this plant. Let plants of *Eranthemum pulchellum* coming in bloom have abundance of water and a warm situation. The *Veltheimias*, *Tritonias*, *Stenolynchus speciosus*, *Lachenalias*, &c., are delightful winter plants; see that they receive due attention. Follow up the directions for the conservatory as to heat and general management.

FORCING PIT.

This structure will now daily become of increasing interest. Early-prepared forcing kinds of Geraniums should be at once introduced into the most airy situation, or on shelves near the glass. Plants of the beautiful kinds of Azalea indica in variety, which have also been well prepared, and have made early sturdy growth, and formed abundance of strong, plump, well-set flower buds, with *Rhododendron* in variety, *Ledums*, *Kalmias*, *Roses*, a few *Pinks*, *Wallflowers*, and bulbs in variety may be placed in succession in a gentle kindly bottom heat, afforded either by means of a tank or prepared fermented material, and moderate syringings with tepid water applied on suitable occasions. Fire heat should be principally applied by day, with a good portion of air. The pit should be shut up early, and night heat applied very cautiously indeed at this season, and still reduce its amount as the solar light decreases. Apply frequent but very moderate fumes of tobacco smoke to destroy the aphid; and slight applications of sulphur vivum liquid to the heating apparatus when nearly cold prevent the attacks of the red spider. Syringe occasionally with well-prepared clarified liquid from chimney soot, to be applied on the principle of "little and often."—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

In wet days looked over roots, as Potatoes, Carrots, &c., and found all in good order. Shed room is of great importance, especially for seedling Potatoes, that they may be spread out thinly. Other roots may be built in banks, with dry soil or small dry twigs between the layers.

A few fine deep-coloured Beet leaves are useful for decorating flower-vases. We are less likely to think of the fine purple leaves being connected with the salad at this season than in the summer time. We have seen rows of deep crimson dwarf Beet far more beautiful than *Peilla* or *Amaranthus*, or even *Iresine*; and where ground is scarce the double purpose of decoration and utility may thus be served, though we confess to a prejudice against using Beet, or the finest variegated Scotch Kale or Borecole in the flower garden. One advantage of the latter is that they lift well with good balls, and as they do not show their colour thoroughly until late in the autumn, they are thus better fitted for moving to make a show in prominent places in the winter months.

The mention of these variegated Kales leads us to notice a prejudice against their use for culinary purposes, as several friends have told us that they are more difficult to boil, are harder when boiled than the green varieties, and that generally when boiled they lose their distinctive colour and become of a dirty sickly yellow. We cannot tell how this can be. In boiling them ourselves we have never used anything but a little carbonate of soda in the water, and in almost every case the white, purple, and crimson variegated Kales keep their colour, and are quite as sweet and tender as the best sprouts of the dwarf Cabbaging Kale. We think all Kales and Cabbages boil softest when put into boiling water. We have known fine vegetables made neither pleasant to look at nor pleasant to eat from being left to soak in merely warm water. Boiling in cookery is but little understood among the humblest, who ought to be best acquainted with it. We knew of a case some time ago where some very strong mutton broth was desirable, but considering the meat used the broth was very poor. The meat was put in when the liquid was boiling furiously. If to boil the meat and keep as much as possible of its good properties from going into the water, then the plan adopted was correct, but quite the reverse when soup or broth was the chief object. The very best vegetables are anything but attractive when spoiled in the cooking. The variegated Kales, when they keep their colour, make a nice variety on the table, and the white-variegated we have often found as delicate and good as Sea-kale.

On a dry day we gathered *Asparagus* seed before clearing the

haulm away. We took up Sea-kale and Rhubarb for forcing, and as Globe Artichokes have grown more than usual, owing to the heat of the summer and the mildness of the first part of the winter, we put some litter round the stools to save them from frost, and if frost should be severe, we have some laurel branches close at hand to stick in round the stools, as the tender growth will make them all the more sensitive to severe cold, and where such things are much run upon a scarcity cannot be easily got over. Pricked-out lots of Lettuces and even Endive, in beds, and at the front of fences, as the trouble is little, and if they stand they will be useful when the warm days of spring and early summer come. Those sown late are looking well, just a little too well, from growing rather much. It is well to have some of these growing thickly under a little protection in case the weather should be severe. We have often found little plants turned out now in soil just surface-pricked over, and a little dry a-hes, or burnt earth, or charcoal-dust sprinkled among them, do better than plants pricked out a month or six weeks ago.

FRUIT GARDEN.

We must refer the reader to what was said in previous weeks as to root-pruning, pruning, planting, top-mulching, &c. We should have been pruning and planting but for a prose of other work. Leaves now fallen from fruit trees in borders should be cleared up or pointed in, to prevent their blowing about. It is impossible to prevent for some time these signs of decay meeting the eye at every turn. You may sweep and roll walks and lawns, but ere long the winds will bring lots of tree leaves, so that until they are all down frequent sweeping is like washing a negro to make him white. Still, in all principal places leaves should be frequently picked up, as to some minds that revel in the beauty of the autumnal tints of the foliage the drifting and fallen leaves always cause melancholy.

We would like to impress on those who resort to root-pruning fruit trees now, in order to make those that are growing too luxuriantly more fruitful for the future, that root-pruning now, whether it is slight or rather extensive, though it will tell on the more stunted growth, will not increase the fertility in the following season. No pruning at the root now will make a fruit bud more mature, or turn a wood bud into a fruit bud. This must be waited for until the summer of 1872. When root-pruning is performed to affect the fertility of the next season it should be so done that the sun of September and October will act on the wood and buds, curtailed of the previous supply of crude sap. With shallow planting and surface-dressing, root-pruning and root-lifting may be reduced to a minimum; though facts tend to prove that many of the finer sorts of Apples and Pears, for instance, that will not grow healthily, nor produce good fruit in unfavourable circumstances, will do both when the trees are kept small and a mass of buds, by frequently lifting and replanting. The summer sun has then more power to thoroughly mature the buds and consolidate the wood. Where the Ribston Pippin could hardly live for canker, even when planted carefully, it has become healthy when the growth was limited by frequent re-budding or root-pruning. We may mention here that the Margil Apple, a miniature Ribston, will often thrive and bear heavily where the Ribston Pippin would hardly live without root-pruning.

ORNAMENTAL DEPARTMENT.

Mowed for the last time, we trust, this season some outlying parts of the pleasure grounds, that grass and leaves may be swept up together. Such material, and especially tree leaves, will be valuable at all times, and more particularly now, for giving a help to many things in the way of bottom heat. One great advantage of tree leaves when thus collected a little damp is that they heat quickly, but the vapour from them is so sweet that it will never injure the most tender plant; so different in this respect from the fumes of fermenting dung before it becomes sweet. When we use dung in rather a rank estate we like to have from 6 inches of these sweet leaves over it, as thus they will arrest all the noxious vapours and prevent them tainting the atmosphere. Let us say, however, to beginners that in using tree leaves, so as to obtain a genial heat from them in a bed or house, it is advisable to let them heat well in a heap first, as such a heat either kills or drives away myriads of small elugs and snails, which otherwise might make great havoc. Decayed leaves, as sweet leaf mould, are so useful that no one with a garden can save leaves with too much care. When intended to be kept for future use for heating purposes they can hardly be collected too dry. For present use it is of no importance though they be damp, and

any grass that may be raked up with them will not at this season make the heat too rank for immediate use.

As just stated, a few leaves will disfigure the finest green-carpet lawn. It is often a good plan to pick these up by hand and place them in a bag or apron. We have seen lawns swept over to get a handful of leaves, when each leaf could have been picked up in a tithe of the time. Of course, when numerous, the broom should be used, but unless very thick no heap should ever be made, nor much ever kept before the broom. After this season the roller is the best friend to the lawn, making all smooth, and keeping wormcasts out of sight.

With planting, ground work, turfing, &c., we shall be busy. The last if done now will give no trouble afterwards. For houses, pot plants, &c., we must refer to recent notices.—R. F.

TRADE CATALOGUES RECEIVED.

P. J. Perry, The Nurseries, Banbury.—*Catalogue of Ornamental Trees, Hardy Shrubs, Conifers, Fruit Trees, &c.*
George Edwards, 1, King Street, Castlegate, York.—*Catalogue of Roses, Fruit Trees, Pelargoniums, Carnations and Picotees.*

TO CORRESPONDENTS.

* * * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

N.B.—Many questions must remain unanswered until next week.

LOOKS (*A Subscriber*).—"The Cottage Gardeners' Dictionary," gives the names, nature, and culture of plants of all kinds. (*J. B. Boyd*).—"The Orchid Manual;" you can have it post free from our office, if you enclose thirty-two stamps, with your address. (*R. Lamb*).—We do not know the book you mention. Mr. O'Donnell's notes we are now publishing in this Journal, will contain what you seem to need.

JOURNAL OF HORTICULTURE (*A. L.*).—It is published to monthly parts as well as in weekly numbers.

DISCORDANT THERMOMETERS (*Tyro*).—You ought to have no such discordance (four thermometers all registering differently, one as much as 8 from another), as you paid good prices for them. Your best resource is to send them to Kew Observatory, enclosing 1s. for each. They will be returned rectified.

GARDEN PLOTTING (*M. E.*).—Apply to Mr. Gibson, jun., 29, Eridge Road West, Battersca, S.W.

GARDEN MATTING WHOLESALE (*Agent*).—Apply to Messrs. Murray and Paterson, 46, Cbnrth Street, Minorities, E.C.

BRICKS (*Self-help*).—A brick is 9 inches long, 4½ inches wide, and 2½ inches thick, and as there are five hundred bricks in a load, you can easily calculate how many loads you will require to build the wall. You must allow some over for breakage and waste. "The Gardener's Year Book" for 1871, gives full information on the subject.

FUELLESS STOVE (*A. G.*).—No stove that could be devised, no fuel, whether coke, charcoal, gas, oil, or paraffin, unless the fumes produced by their combustion are conveyed away by a flue, can be employed among plants without injuring them.

PARADISE PIPPIN (*A. Q.*).—The Paradise Pippin is not a bad bearer, and is not generally long before it comes into bearing. Your tree on the Crab stock is probably in good soil, and too closely pruned. This will induce the formation of wood, notwithstanding the root-pruning you have subjected the tree to. The variety is not of such excellence that you need inconvenience yourself with it. Let the tree have more play, and perhaps it will do better.

APPLE PIPS SOWING (*Andrew Robertson*).—To keep the Apple pips fresh till the spring, leave them in the fruit; or, if this should decay, mix some sand with them, and in March sow the pips either in pots or pans if the quantity is small, or in the open ground in ordinary garden soil if there is a large quantity of them. We think Golden Leadington a good name for the large Apple. It is well worth propagating.

BUDDING CAMELLIAS ON ORANGE AND LEMON-TREE STOCKS (*C. J. S.*).—Budding or grafting Camellias on Orange or Lemon stocks is not likely to prove successful. Why not graft the stocks with Orange and Lemon scions? They would then give you both flowers and fruit.

SOWING TOM THUMB TROPEOLUM SEEDS (*Idem*).—Now is not a good time to sow the seed, and, indeed, it would be useless doing so, as the plants are more tender than Geraniums. March is quite soon enough to sow the seed out of doors. The *Viola cornuta* we would not sow until February, and then in pots or pans in the greenhouse.

RIVERS' VICTORIA NECTARINE AND PRINCESS OF WALES PEACH (*C. R.*).—Though a horse with fire heat is considered to improve the flavour, we have known them grown fine in a cool house, and that we consider is all they require.

GRAPES RIPENING IN A VINERY WITHOUT FIRE HEAT (*Idem*).—Of the kinds you name, Gros Colmar, Lady Downe's, and Black Muscat of Alexandria require fire heat; the others will do in an ordinary vinery.

EVERGREEN FOR SCREEN (*W. B.*).—The Austrian Pine is the hardest and quickest-growing evergreen tree we know; but to have an effectual screen of it you will need two rows instead of one. American Arbor-Vitæ is a quick, close-growing evergreen, that would serve your purpose, only you will need to get large plants to begin with, or wait a considerable time, and if the place be much exposed there is a danger of the tops being

destroyed after the shoots overlap the wall. It is, however, very hardy. You may safely plant it when 6 or 8 feet high, and it should not be more than 3 feet apart. They need no attention beyond planting now or early in March, watering during dry weather in summer.

SELECT TEA-SCENTED ROSES FOR OUT-DOOR CULTURE.—Gloire de Dijon, Abri-côté, Vicomtesse de Cazes, Devoniensis, Adam, La Boule d'Or, Madame Levet, Janne d'Or, Belle Lyonnaise, Adrienne Christophe, Monplaisir, and Madame Damazin. Kenne's "In-door Gardening" will suit you for the management of the greenhouse; and for florists' flowers, "Florists' Flowers for the Many." The former can be had post free from our office for twenty postage stamps, and the latter for 4jd.

PLANT FOR COVERING A SLOPING SOUTH-WEST BOWER (A. Z.).—Plant *Cotoneaster microphylla*. Ivy is very fine for such purposes, but in our opinion does not equal the *Cotoneaster*, which has pretty white flowers in May, followed by bright red berries in autumn, and it is of close dwarf growth. The irregular growths should be removed in August.

DISA GRANDIFLORA NOT THRIVING (J. G.).—We think your plant is becoming unhealthy. We should advise you at once examining the soil, and if that is at all saturated or sour replace it with fresh, and let the drainage be thoroughly effective. Water carefully, but keep the soil regularly moist. It is well to set the pot in a saucer of water, raising the pot on three pieces of sandstone. At this season the water should not reach the pot. A cool airy greenhouse is the most suitable position; the temperature ought not to fall much below 45°. Spring is the best time to shift the plant into a larger pot. We think your plant is suffering from want of heat. Avoid a close atmosphere.

OAK-LEAVED PELARGONIUM LEAVES YELLOW (Yellow Oak Leaves).—The present condition of the plants is probably due to the great heat to which you are subjecting them; 50 to 60° is quite hot enough for a stove. The old leaves that are bronzed now will soon fall, the heat having caused their ripening; and the golden colour, which we presume is on the young leaves, is caused by their growing so quickly at this unnatural season. Probably they will come to their natural colour when placed in a light airy position in a house with a temperature of 40 to 45°. The old leaves, however, will all fall.

TRANSPLANTING VINES (J.).—It is not too late for removing your Vines. We have not found the fruits sent. Are you sure they were left at our office?

TRAINING VINES (M. H.).—Your proposed plan will answer very well. You might take a part crop from the top part of the two Frontignans the first year or two, until the new rods from the Black Prince became strong enough. You might also utilize the stems of the Frontignans, if you thought proper, by grafting the other young shoots on them. We have no doubt the rods will soon be strong enough without that trouble. It is seldom that the White Frontignan shrivels up. It is, though small, one of the best-flavoured Grapes, and a free bearer.

MOVING VINES (M. H.).—The Vines planted twelve years ago may be removed, but we do not advise your doing so. It is better to plant young Vines, which will be better and come into bearing nearly as soon as those which are lifted. The best time to lift them is early in March, taking them up carefully and covering the roots with mats to protect them from sun and wind. In planting spread out the roots carefully. No shortening of the Vines is necessary beyond the usual pruning, which ought to be done in December. The best compost for Vines is the top 2 or 3 inches of an old pasture where the soil is a good light loam; that of chopped up rather roughly nine cartloads, old lime rubbish one cart-load, eight bushels of half-inch bones, a like quantity of charcoal as lumpy as possible, and two bushels of calcined oyster shells, the whole well mixed. The sods are best used fresh. The Vines will not fruit next season.

VINES (J. Mackenzie, M.D.).—All the Vines you mention, with the exception of Chasselas Vibert, Furtado, and Royal Ascot, require a high temperature. These will do in a house with the heat ordinarily given to the Black Hamburg. The foliage of Mrs. Pince is deeply and finely cut.

VINES WITH ENDS GROWING (G. F. B.).—In your case, as you must cut the rods of your Vines back, we would either remove the part of the ends with green leaves now, or take away the leaves. The wood, we have no doubt, is ripe enough, and a period of comparative rest will suit the Vines now. As to keeping plants in the house, see note in page 412. Clear lime water is the best thing you can use, and the safest means you can try for dislodging worms from pots plants. If you cork-up the drain-hole for a few hours and saturate the soil, the application will be more effectual. Do not, however, allow the cork to remain.

MANURING VINES (M. B.).—Vines with their roots entirely inside the house need manuring, and it is best given as surface-dressing. We would use an inch of your poultry-yard manure all over now, and when that is pretty well washed in, by the early part of the summer, you could add a little more. If the roots are all inside, they will have no watering except what you give them. If the soil is rather dry now and you mean to start in December, we would use water at from 61° to 70° in temperature.

DESTROYING FAIRY RINGS ON LAWNS (C. H.).—See No. 499, October 20th, page 315.

SELECT POTATOES AND THEIR CULTURE (One wishing to improve himself and others).—Four varieties of Kidney Potatoes—Ashleaf, Rivers's Royal, Veitch's Improved, and Myatt's Prolific are good varieties; Lapstone, Milky White, and Berkshire Kidney; and of Round—Early Oxford, Dalmahoy, Flour Ball, and Bovinia for size, though it is inferior to Victoria. Your soil being very stiff we advise your manning it at once, and having it deeply turned up, and as roughly as possible, for the winter. The mixing with road scrapings would be advantageous. We would not give the dressing of bone dust until planting time, and then you may sow it broadcast. It is good, but for Potatoes we consider Peruvian guano preferable, 2 to 3 cwt. per acre being a good dressing.

LICUID MANURE FOR GERANIUMS AND CAMELLIAS (Idem).—Guano water is beneficial to any kind of plants needing vigour; it should be given of the strength of 2 ozs. to the gallon once or twice a week. At this season, however, it is not required. For Camellias swelling their buds, liquid manure formed of sheep's droppings is best—one peck to 30 gallons of water; cowdung, one peck to 20 gallons of water answers well.

COMPOST FOR MRS. POLLOCK GERANIUM (Agnes).—When it can be had fresh loam from turf is undoubtedly the best compost when enriched

with a fourth of well-rotted manure, adding a sixth of silver sand. To your strong loam add one-fourth of leaf soil, and a like quantity of sharp sand. This compost, with good drainage ought to grow them well. The most likely cause of the greenhouse *Pelargoniums* having but few flowers in a truss is weakness, which may be a result of poor soil, and quite as likely of a weak growth occasioned by growing them too far from the glass, and not giving a sufficient amount of air. They can hardly have too much air and light.

EUCHARIAS AMAZONICA (B. P.).—By plunging the pots in a brisk bottom heat it is likely they would start for flower or throw out flower scapes, but the flowering will be entirely dependant on the previous treatment. The essentials are to give the plants plenty of heat, and an abundant supply of water and moisture when making new growths, and then place them in a light airy position, but in a good heat, giving no more water than is useful to keep the leaves from flagging. This treatment continued for three or four months, and the plants then returned to bottom heat and moisture, will generally ensure a good bloom; but keeping them constantly growing seldom results in anything but the production of leaves. To have Strawberries ripe at the end of March, forcing should be commenced early in January, and the plants should now be under cover in a cold frame or cool house.

VALVE OF HOT-WATER PIPES (H.).—We do not think it matters whether the valve in your pipes is on the level or between two pipes, the one perpendicular to the other, or in a slanting direction, provided no impediment is given to the free circulation. Valves are chiefly necessary for flow-pipes to different places, leaving the returns to look after themselves.

NAMES OF FRUITS (C. R.).—1, Winter Greening; 2, Vicar of Winkfield; 3, Devonshire Buckland; 4, Ghou Morcau; 5, Chester Pearmain; 6, Old Colmar; 7, Robinson's Pippin; 10, Downton Pippin. (A. S. D. H.).—Pears—1, Meuris Permain; 2, Princess Charlotte; 3, Lewis; 5, Ne Plus Meuris; 6, Beurre Dufais; 7, Old Colmar; 8, Worm-ley Grange. POULTRY, BEE, AND PIGEON CHRONICLE.

BIRMINGHAM POULTRY AND PIGEON SHOW.

THIS, the twenty-second Exhibition, was superior in numbers of poultry, but inferior in numbers of Pigeons, to its predecessor. It commenced on the 26th of November, and concludes to-day. In quality, though there were some grand exceptions, the birds were much inferior to those of last year. There were 1971 entries of poultry last year, and 2125 this year; 482 entries of Pigeons last year, and 453 this year.

The following is a comparative statement of the entries in this and last year:—

	1869.	1870.		1869.	1870.
Dorking	331	294	Other distinct breeds..	23	12
Spanish	79	72	Game	396	374
Cochin-China	260	323	Bantams	142	174
Brahma Poutra	233	261	Ducks	116	120
Mohay	18	27	Geese	34	36
Crève-Cœur, Houdan, and La Fleche	97	107	Turkeys	50	67
Hamburg	181	195	Pigeons	482	453
Polish Fowl	56	63		2453	2578

The first-prize Rouen Ducks were again heavier than the Aylesbury, the drake and Duck weighing 19½ lbs., being 6 ozs. more than last year. Mrs. Seamons's prize Goose and gander weighed 62½ lbs., just 5 lbs. heavier than the heaviest last year. But America whipped us in Turkeys, Mr. Simpson's bird, of New York, weighing 36½ lbs., which was just 1 lb. 2 ozs. heavier than the second-prize cock belonging to Mr. F. Lythall. The heaviest last year weighed 34½ lbs.

DORKINGS.

1. The old Grey cocks numbered twenty-two, exactly the same as last year. Mrs. Arkwright came first with a grand old cock, weighing 13 lbs.; he had one foot deformed, but in spite of this fault no other bird came near him. The second prize was a very fine dark bird, with good legs. Third prize a very dark cock, with a good body, but very bad feet and toes. Fourth prize a fair average bird, but out of condition. The last entry in the class (22) was a bird of fine frame, but very tender on the feet; indeed, nearly all the class seemed much afflicted in this way, and, except the prize birds, very moderate in quality.

2. The cap cockerel was a very neat bird with remarkably perfect feet, but would not have been large even for a Silver-Grey; he was only entered at three guineas, and the award was generally thought an error. Second prize a fair, good bird, but toes rather faulty. Third also a good bird with imperfect feet. Fourth prize deserved the position well, and ought perhaps to have been higher. Fifth prize a fine-framed bird, but one foot very bad indeed. We liked the sixth prize much better, and thought it more deserving than the cap bird. The greatest error in this class, however, was in passing over (34) a beautiful bird every way, and which ought to have had at least the second prize, if not the cap. This was a good class.

3. The first prize here were a grand pen, good in frame, legs, and feet. The second prize scarcely deserved the honour, one hen having

feet very much deformed. Third prize a good pair every way, and well placed. Fourth very middling, not nearly so good as pen 122. The fifth prize we liked far better than the second. This class was moderately good, and we thought darkness of colour seemed to have governed the awards a good deal.

4. The cup pullets, a noble pen, and in their place; one pullet perhaps a little down in the fifth toe, but hardly any other fault could be found. Second prize a good pen, but not so good as several others, particularly pen 157. The third prize contained one remarkably fine bird, but the other far too weedy for a prize pen. The same may be said of the fourth, which we thought better of than the third, one bird being unusually fine. Fifth prize were also very unequal in both size and quality, or most have been higher, and the same may be said of the sixth prize. Indeed there were grand single pullets all through the class, but except the cup pen there was hardly a pullet good year to be seen.

5. The first and second Silver-Gray cocks were good birds and well judged, regular Dorking frames, and much style. The third good in size and colour, but both feet in a frightful state. The fourth had a deal of white in the throat, and several specks on the breast; the next pen (228) we thought better of. The fifth a pretty bird, with good feet but yellow. Pen 216 contained a beautiful and large bird, and most have been second but for some white mottling on the breast; as it was we fancied him better than the fourth. On the whole this was a fair class, but several of the birds had no business in it.

6. The pullets we thought not nearly so good as last year. First prize a very nice pen, and deserving the honour. Third prize, a pen of good average excellence; also fifth; but we should have made the second and fourth prize exchange positions, the fourth prize being much finer.

7. The first prize White cock was a really grand one. Second also good, and but for a rather fanly comb would have run the other hard for place. Third prize very handsome and stylish, but rather wanting in substance. Pen 264 contained a massive bird, but with imperfect feet, which probably kept him from displacing the third prize. This class showed much progress.

8. The prize White hens were good birds, and correctly placed, but the rest of the class was far from equal to the cocks.

COCHINS.

9. The Buff cocks did not answer our expectation. The cup was a fine massive dark bird, rather clumsy, but a little mealy in the quills of his wings. Second prize and third prize much better in shape and colour, but smaller, and the third prize scaly on the feet. Both these birds had lost their tails, either naturally or by artificial means. As they belonged to the same exhibitor, we fear the latter. The fourth we did not like, being small, and mealy on the saddle. Fifth very large, but not well set up, and Buff several shades darker than the breast. Mr. Barnell's, No. 313, was a fine bird, and we thought worth more than he got. The rest were inferior for a Birmingham class.

10. The cup cockerel was magnificent, and only wanted a little more leg feather to make him perfect. He showed that fine even deep gold colour which is now getting rare. The second prize was almost a cinnamon, splendidly feathered, and fine shape. He would have been better had his wings been carried better; but as he was, no other bird could have been given his place. Third, a fine Cinnamon, honestly shown, and also deserving of his position. Fourth, rather light for breeding, but very even in colour, as was also the fifth prize. The sixth had a mealy wing, but good in other points. Pen 365 was a remarkably good cockerel, but rather light in colour. The four pens last mentioned had an uncommonly short allowance of tail.

11. The cup Buff hens were fair, but one was far inferior to the others, and we thought them far inferior to Mr. Cattell's third-prize pen, which were a long way the best in the class. One hen in the second-prize pen had a badly slipped wing. The fourth and fifth were good average pens, and we rather thought the highly commended pen, 404, ought to have displaced the latter pair. We did not think this class nearly so well judged as the preceding.

12. The cup pullets were badly matched—the larker a grand bird, but the other mealy in colour, and weedy in shape. We thought the second prize better. Third prize a decided error, the birds having no fluff or cushion, and very little of the Cochin about them. Mr. Alfred Stretch's pen, 416, should, we think, have had this position. The fourth, fifth, and sixth promised well, but needed a deal of filling out yet, and we greatly missed the fine-shaped birds Mr. Mapplebeck used to show in this class.

13. Except the prize birds, Partridge cocks were a poor class. First prize a very fine bird, but we liked the third prize better than Mr. Tudman's second, the latter showing the least possible suspicion of being round in the back.

14. In the cockerel class we did not much like any but the first prize bird.

15. The first prize hens were fine, but not so good as Mr. Tudman has shown before. The second prize contained one beautiful hen, but we preferred the same exhibitor's highly commended pen, 529.

16. The first prize pullets were a very nicely-marked pair, with specially neat heads. It would be rather a hard choice between them and second, which were very like them. The third prize were small, and did not look their age. Fourth very middling, and hardly any of the birds equal to the winners of last year.

17. Of the White cocks we liked the second prize best, the first being very yellow; the third very large, but almost bare-legged.

18. The first prize cockerel well shaped and clear, but small. The rest nowhere. In both these classes the birds seem to us to be losing fluff and shape.

19. The first and second prize hens were good pens, and nicely shown. Third prize very large, but exceedingly dirty. The highly commended pen, 595, almost deserved an extra prize.

20. Of the pullets, the second prize was certainly better than the first; both pens being very neat, but all the White Cochins decidedly need more attention to be given to shape.

BRAHMAS.

21. The old Dark Brahma cocks were exceedingly well judged, the first prize, especially, being magnificent. The second prize was the same as won second at Bristol in January while the cup-winner at Bristol and Birmingham was unnoticed on the present occasion, having moulted very light.

22. The cockerels were very inferior to last year's lot taken as a whole. The cup was taken by a very fine bird, but much too dark. Second and third good shape and colour, but small. Fourth a beautiful bird, and we think he ought to have had the cup. The fifth was inferior to several highly commended birds, and the sixth prize was much too narrow for a Brahma.

23. We think that the hens also were mistakingly judged, Mr. Lacey's third prize hens being the best in the class. The second prize was correctly placed, but Miss Pennant's highly commended pen (731) ought to have been third, in spite of rather a brown tinge.

24. The greatest mistake of all, however, we consider, was in the cup for dark pullets, which was given to a pen absolutely worthless, either for shape, size, or marking, and badly streaked with white. They were infinitely inferior to Lady Gwydyr's pen 763. The second and third pens were fine large dark birds. The second prize should have been first. The sixth prize were remarkable for fluff, but in other respects only middling. The best pair by far were dreadfully out of condition, and deservedly obtained only a highly commended, notwithstanding which they were bought by a well-known breeder at a good price. There were several other very good pens up and down, but the total value of the class would not be half that of last year.

25. The Light cocks showed progress, the first prize only needing rather more feather, while the second would have run him hard but the huckle been better striped. The third had a Cochin style of tail we did not like.

26. The first prize for cockerels went to a "pretty" bird of fine shape, but with wattles much longer than earlobes, which we did not like, and tail too much sickled. The second prize belonged to the same exhibitor, and was very similar, but better in tail. The third was a splendid bird for size, and in wonderful condition, considering he had crossed the Atlantic, but short of feather. Fourth, a nice clear bird, but rather too heavy hooks for the amount of feather his legs carried. We thought Mr. Pares' highly commended pen, 829, ought to have displaced one of the first two prizes, while a highly commended pen, 819, was the best-shaped of the lot, but small and dark in surface colour. This last bird will show far better as a cock next year.

27. The first prize Light hens were fine birds, very fairly feathered, and with good fluff. The second wanted cushion. The third prize were grand birds, and but for their Atlantic voyage must have been second. The best single hen was in pen 847, but her companion was nowhere.

28. The first prize pullets were very fine and rightly placed, though one would be better with more cushion. The second heavily feathered, but dirty, and with a strong suspicion of being hooked. Third prize uncommonly weak, but small. Fourth prize very fair, with dark but cloudy hackles. There was an American pair of pullets also, very large, but poorly feathered, and out of condition. There were several pens deservedly highly commended, and on the whole all the Light Brahma classes showed marked improvement in contrast to the deterioration of their dark relatives.

MALAYS.

29—32. There were twenty-seven entries of Malaya, and the classes contained several birds much better than usual. Being small classes they were, as a whole, well judged, but the first prize cockerel was quite destitute of the characteristic prominent Malay shoulders, and we thought the pullet, No. 903, better than that in the second prize pen.

CREVE-COEURS.

33. The Crève-Cœur cocks were of pretty fair quality, and the first prize a grand bird; second also a fine bird, but very much out of condition. Mr. Blinkhorn's pen, 919, was very fine, and also pen 907. The latter we thought might have had second prize.

34. We did not like the first prize hens, and thought the third prize pair the best in the class in all but the crest, in which the second prize surpassed them.

HOUDANS.

35. The Houdan cocks were a good class and well judged. Pen 956 must have been in the prize list but for his feet, which were very bad. Several birds, indeed, showed signs of bumble foot.

36. Both first and second prize hens were beautiful birds; third prize rather small but nicely shaped, and very dark. In both classes the colour was much improved, coloured feathers being rare.

LA FLECHE.

37. Of La Flèche cocks there were only four entries, and one of these was not sent. The third bird was shockingly out of condition, which made winning very easy.

38. The hens were in better order, but the second prize was a manifest error, being half-bred with Minorcas. This was evident all over, the birds having Spanish bodies, red faces, and one an actually flapping comb.

SPANISH.

39. The first and second prize cocks very good, but very full over the eye. Third free from this fault, and would probably have been second, but he was out of condition.

40. First prize cockerel a very good bird with nice comb, but not nearly so good as the third, which ought to have been first. Second prize very rough, and will soon be nearly blind. Fourth and fifth pretty good. Sixth prize a regular pullet's face, very cleanly shaved.

41. None of the hens in really good condition, but the second deserves mention as being shown and winning in the natural condition.

42. Much interest was exhibited in the Spanish pullet class from eight breeders having entered into a sweepstakes of £5 each, in addition to the prize list, which was divided into three prizes of £20, £12, and £8 respectively. The first prize were a splendid pair, but the second were, we think, not nearly so good as the third; and Mr. Barry's pen, 1079, third, putting the second prize as fourth. All the Spanish classes were as a whole inferior, though with some beautiful birds.

HAMBURGHIS.

43. BLACK.—The first Black Hamburg cock was magnificent, the second very good, but the third had a flabby comb which spoilt him.

44. The prize hens all good pens, but one in the third prize pen had a very bad comb, and we liked pen 1113 better.

45. GOLD-PENCILLED.—The second Gold-pencilled cock was better in tail than the first, but worse in comb; the third better than either but for many foul feathers in the under parts.

46. Hens were very middling. Third prize in bad health, and on Monday had decided roup. This class seemed losing colour.

47. SILVER-PENCILLED.—The first prize cock had a large comb, but his tail was beautifully edged. The second prize bird was a beauty. The third and fourth were fairly good.

48. In hens the first and second were well marked, but the third rather poor.

49. GOLD-SPANGLED.—The first prize cock was a magnificent bird; the rest very good, and on the whole well placed. This was a good class.

50. Hens also good, and first two prizes very accurately marked on the cushion.

51. SILVER-SPANGLED.—The first prize bird had a bad breast, but by far the most perfect tail we ever remember seeing. The second had a beautiful breast, but otherwise much inferior. Rest fair average prize birds.

52. In the hens many were too dark, and of those which were not, several had moulted considerably. All the prize pens were good, but we thought the third as good as any.

POLANDS.

53—58. The Polish classes were very much better than usual. The prize Golden pens were particularly fine in marking, and made it very easy to see where the Sebright Bantams came from.

ANY OTHER VARIETY.

59. In ANY OTHER VARIETY the third prize was a great error, the Creeper hen having feathered legs and also a Cochinchina head—in fact, a cross-bred bird. Much interest was awakened by Mr. Simpson's pen of Dominiques, which happened to be next to a pen of Cuckoo Dorkings. The marking and general appearance are precisely similar, but they had yellow legs, single toes, and rose combs. But for there being two hens this pen ought to have been third.

GAME.

60. The Black Red cocks did not seem a remarkable class, and many birds showed defect in the hock toe. The first prize was a beautiful bird in good condition, but we thought Mr. Challoner's, 1355, ought not to have been far off. Second prize rather darker in colour, and both second and third seemed a little long in the thigh, but we heard little fault found with the judgment. Many of the prize and other birds in the Game classes showed this tendency, which seems to us increasing.

61. The cup cockerel was really a beauty, and no one could quarrel with his position. The second prize of the same owner was nearly as good. Third prize a very tight, compact bird. The fourth prize looked to us rather more of a "cocker's" bird than some of the others. Fifth prize too long in thigh for our fancy, but hard in feather and body. Sixth prize a particularly good head, sharp and thin. The highly commended bird, 1401, had thighs at least 4 inches long. Several cockerels in this class looked to us too large for Game fowls, and at least one showed a very strong cross with the Malay. The judgment in these two classes we thought very fair on the whole, but to go, perhaps, a little too much by the tail's.

62. The first Black Red hen was a fine gamey bird, but we thought her a little too plump. Second prize very neat and trim, and third ditto, but apparently with rather less than her share of hackle. The rest of the class hardly up to the mark.

63. The pullets were far better. First prize a beauty, just the size, and head, neck, legs, and body, alike good. The second prize a good medium-sized bird, with fine spreading toes. Third prize very good in all but one point, a very sharp angle between the head and the beak, which a Game bird ought not to have. The fourth we did not like much, and the fifth, which was a beautiful gamey bird, ought to have taken her place, if not put third, which might have been better still. Sixth, rather too much flesh to our liking, but for which we think she would have cut the work out for at least two or three of the others to heat her.

64. The first prize Brown Red cock was rather large, but both this and the second prize were fine thorough Game fowls, and however they settled it, ought to have had the first two prizes. Third prize nearly, if not quite as good as the first. Fourth, a little too big, and we are not sure we should not have changed fourth with fifth, which we liked much. Pen 1527, was also a fine bird, but this class was admitted to be well judged.

65. The cup Brown Red cockerel seemed to us only a fair bird, but was shown in capital feather. The second and third must have been hard to choose with him. Fourth prize rather too dark in colour for a Brown Red. Fifth and sixth deserved their places. Not a very good general class.

66. Mr. Brierley's Crown Red first prize hen was perfection, but we thought the second prize weedy and had. Third a very nice bird, particularly good in the neck. Fourth prize also a very good hen.

67. In the pullet class, Mr. Brierley repeated his success with a super-excellent bird, hardly a fault about her. Second prize good, but a little red in the face. The rest of the first prize birds we thought well placed, in a really fine class.

68 and 69. The Duckwing cocks were a rather small class. We think pen 1620 should have displaced at least the third prize, but otherwise they were admitted to be well judged, as were the cockerels, except the fifth prize bird, who carried his wings very high, almost over his back. There were several birds, especially pen 1646, which might have had his place with advantage.

70. Two prize Duckwing hens were good, but except one of Mr. Fritill's, the rest were poor, and the entries were only seven in number.

71. The pullets were better, and the first was a beauty. We thought the third about as good, but did not like the second much, and cannot call it a remarkably good class for Birmingham.

72. The Black Game cocks and cockerels appeared rather heavy, which has been a fault of late years. The first prize was a long way ahead, but had to be removed elsewhere for the welfare of his next-door neighbour.

73. In hens or pullets, the first-prize bird was a beauty in every way. Second was of good shape, but as red in the face as a Minorca.

74. In the White and Pile cocks, the first two birds were unusually good, and rightly placed, but we thought either 1705 or 1710 better than the third prize.

75. The first-prize bird in the female department struck us as one of the very best-shaped birds in all the Game classes. Second and third good fair birds, but the rest of class we thought poor.

BANTAMS.

76—82. The Sebrights were numerous and good, the Silvers particularly fine. They are again getting white. The White Bantams were mostly too large, but it was a large and good class, the first prize being gems. Black also very good, the fourth prize rather wanting in style. In the "Any variety," the first prize went to a good pair of Pekins, the second to a pen of Japanese, with the most perfectly marked tail ever, perhaps, seen. Black Red Game Bantams were a grand class. In the first prize pen, the cock and one hen were perfection, the other not so good. We were sorry to see that some disappointed miscreant had pulled out one of the cock's sickle feathers. Many of the birds in this class carried their wings low. In the Brown Reds, the second-prize pen contained a poor cock, but the hens were much the best in the class. These two classes were, however, very hard to judge, there being so many good pens.

83. In the "Any variety" Game Bantam class, the first and second were both good pens, but the third prize pen of Piles was a great error, there being another pen of Piles worth fifty of them. In fact, this pen (1855) of Mr. Easton's was said by many to be the best in the class; and though the hens did not quite match, the birds were so unusually "gamey," as well to deserve that position.

84. In the Black-breasted cock class, the first prize was a fair bird, but too much hackle; second a middling bird, but in magnificent condition. Third, fourth, and fifth a good average, but we thought several pens rather better. In the "Any other variety" (85), the first was a Pile of very good quality; the third also a Pile, but not so good; the second a Duckwing rather too dark in colour.

DUCKS, GESE, AND TURKEYS.

Aylesbury Ducks were large and fine, the weight of the four prizes respectively being 18 lbs. 9 ozs., 18 lbs. 10 ozs., 17 lbs. 10 ozs., and 18 lbs. 4 ozs. Rouens were again heavier, weighing 19 lbs. 4 ozs., 18 lbs. 6 ozs., 18 lbs. 2 ozs., 17 lbs. 11 ozs., 17 lbs. 4 ozs., and 17 lbs. 5 ozs. respectively. The first prize pen of the latter breed was magnificent, and it is worth remark that twenty pens were noticed by the Judges. The Blacks were a very nice class and in good condition. In the "Any variety" Duck class the Mandarins and Carolinas showed in great force, and the prize birds were more perfect

in marking than ever. The ladies lingered round this class. 2015 was a beautiful pen.

The White Geese weighed 58 lbs. 12 ozs., and 56 lbs. 5 ozs.; the young ones 19 lbs. 1 oz., and 19 lbs. Grey, 62 lbs. 6 ozs., and 51 lbs. 6 oz.; young ones, 33 lbs. 6 ozs., and 49 lbs. 1 oz. The first prize old Greys were really enormous, as the weight will show.

The first prize for all Turkey cocks was won by a splendid bird sent over by Mr. Simpson. Notwithstanding the voyage he was in the best order of any in the class, and weighed 36 lbs. 4 ozs., being said to have gained several pounds on the passage. The same gentleman was very highly commended for a crested bird. The second prize weighed 35 lbs. 2 ozs. The young cocks were 21 lbs. 6 ozs., and 23 lbs. 12 ozs. respectively, and seventeen pens were distinguished by the Judges. Old hens weighed 35 lbs. and 31 lbs.; young ones 31 lbs. 4 ozs., and 29 lbs. 1 oz. These weights have been somewhat exceeded, but are very good.

Looking over the whole Show, in spite of many individual exceptions, we were struck with its great inferiority in quality to the usual Birmingham average, which may probably be accounted for by the Crystal Palace Show next week. Greater dissatisfaction than usual of late was also expressed with the awards. This may partly be accounted for by the great waste of judging power caused by dividing the Judges into parties of three each; but much more, it seems to us, by the extremely bad light this year, which told severely on the lower tier of birds. If by any other order of the classes the lower rank could be filled by those breeds which bear a bad light best, we are convinced many otherwise unaccountable errors would be avoided.

In point of attendance, and also of sales, the 1870 meeting was very successful.

[We hope to give notes on the Pigeons next week.]

DORINGS (Coloured, except Silver-Gray).—Cocks.—1, Mrs. Arkwright, Sutton Scariside, Chesterfield. 2, Gunson & Jefferson, Whitehaven. 3, J. Faulmer, Burton-on-Trent. 4, Admiral W. Horn's, Poole. 5, Admiral W. Purney, H. Yardley, Birmingham. Rev. E. Colclough, Wal on Parsonage, Warwick.

DORINGS (Coloured, except Silver-Gray).—Cocks. 1, and Cup, Glessall and Waller, Milnthorpe. 2, and 4, Mrs. F. Wheatley, Belper. 3, Proves, Ingatestone. 5, R. B. Wood, Woodburners. 6, J. White, Warrington, Norththorp. 7, Henry Woodcock, Warkington, Goodham Marlow. 8, Rev. J. A. Baker, Old Warden, Biggleswade. 9, Andrews, Tuxford, Newark. 10, Parlett, Great Baddow, Chelmsford. 11, Gunson & J. Beeson, Whit haven. 12, Countess of Dartmouth, Pat-bull, Alburgh. 13, Wolchampton, Gunson & Jefferson (2); Mrs. Scamons, Hartwell, Aylesbury. 14, White, Warley, Northampton. 15, W. Rutledge, Shortland, Kendal. 16, E. Shaw, Plas Wilnot, Oswestry. R. Wood, Clapton, Thrapston.

DORINGS (Coloured, except Silver-Gray).—Hens.—1, J. White. 2, Rev. E. Colclough. 3, and 5, L. Patton, Hillmore, Tamworth. 4, Gunson & Jefferson. 6, T. Statter, Watfield. 7, Mrs. Arkwright. 8, Watta, King's Heath, Birmingham. Earl of Chesterfield, Prestly Hall, Burton-on-Trent.

DORINGS (Coloured, except Silver-Gray).—Pullets.—1 and Cup, L. Patton. 2, Mrs. E. Wheatley. 3, R. W. Beachy, Blunder House, King's-croft. 4, J. Fox, St. Eves. 5, Mrs. Arkwright. 6, L. Patton. 7, Mrs. Hart, Alderley-joy. 8, H. Wingwood. 9, Gunson & Jefferson (3). 10, J. White; Mrs. Bird; Mrs. Scamons, Hartwell. 11, Silver. 12, Hon. Lady Bazel, Blithfield Hall, Epsley.

DORINGS (Silver-Gray).—Cocks.—1, Hon. Lady Bazel, Blithfield Hall, Epsley. 2, Gunson & Jefferson. 3, O. E. Cresswell, Bagworth Rectory, Rotham. 4, T. Statter. 5, R. Smalley, Lam Milla, Loughborough. 6, Gunson & Jefferson.

DORINGS (Silver-Gray).—Hens or Pullets.—1, R. D. Orr, Otter Head, Windermere. 2, J. Horton, Shirley. 3, W. W. Rutledge, Shortland, Kendal. 4, R. Smalley. 5, W. A. Beach, Shirley. 6, J. Watta, St. W. W. Wood, J. Gordon.

DORINGS (White).—Hens or Pullets.—1, Mrs. E. Farnham, Walsby. 2, J. Choyce, Pinball Garage, Atherton. 3, and 4, Rev. T. Peake, Gazeley Vicarage, Newark.

DORING (White).—Hens or Pullets.—1, S. Robinson, Gunstang. 2, Hon. Lord Sudley, Tuddington, Wiltshire. 3, J. Choyce. 4, Rev. T. Peake; O. E. Cresswell. 5, Miss Fairhurst, Choyce.

COCHIN-CHINA (Cinnamon and Buff).—Cocks.—1, Cup, and Extra, Mrs. R. White. 2, and 3, W. A. Taylor, Manselwood. 4, C. Felton, Birmingham. 5, H. Bondman, Mosley. 6, H. Farley, H. Bondman.

COCHIN-CHINA (Cinnamon and Buff).—Cocks.—1, Cup, and Extra, and 5 and 6, W. A. Taylor. 2, G. H. Proctor, Durham. 3, Mrs. R. White. 4, Hon. CHIPPENHAM POULTRY SHOW.

This Show is always held in connection with a show for breeding and fat stock, coupled with one of the best competitions for cheese in the country. With the most excellent accommodation for a show of limited numbers it has for many years been remarkable for the perfection of the poultry entered. A few years ago its strength seemed to be centred rather in the useful breeds of poultry than the strictly fancy varieties now so much sought after by amateurs. Even to this show for Geese, Turkeys, and Ducks, few of even the most popular shows can contrive that at Chippenham, and the crossbreeds for table purposes were as well shown as heretofore.

This year, however, the *Game* fowls were of superior character, the *Buenos Ayrean Ducks* were extraordinarily good, and the *Dorkings* and *Cochins* were scarcely less commendable. *Hamburgs* were good, and the *Polands* shown by Mr. Hinton, of Warmistone, were among the most perfect we have seen for a long time past. A beautiful hybrid, bred between the wild English Pheasant and a *Game* hen, was one of the most attractive features to general visitors. From the weather proving most favourable, in the admissions at the gates this surpassed any former show.

DUCKINGS—1, Rev. J. C. Hoysted, Bradenstoke. 2, Miss J. Milward, Newton St. Loge. c. G. Hanks, Malmsbury; J. Butler, Tetbury.

SPANISH—1, G. Tonkin, Bristol. 2, G. Hanks. *hc*, R. C. Forster, Freshford.

GAME—Black-breasted and other Reds—1, W. H. Stagg, Netheravon. 2, O. Viveash, Berwick Bassett. *hc*, W. H. Stagg. c. E. Baily, Chippenham. *Any other variety*.—1 and 2, G. S. Sainsbury, Devizes. c. G. S. Sainsbury; E. C. Phillips, Brecon.

COCHINS—1, Miss Milward. 2, D. W. Thomas, Brecon. c. J. S. Maggs, Tetbury.

DORKINGS—1, W. Hanks, Somerset. 2, H. P. Moor, Langley Burrell. c. Rev. J. D. Hoysted (2); J. Kiogdon, Calne.

HAMBURGERS—Gold or Silver-pencilled—1, H. H. Thompson, Colehill. 2, T. Sealey, Somerset. c. J. W. W. Hubert, Chippenham. *Gold or Silver-spangled*.—1, C. Maggs, Melksham. 2, J. Powney, Calne. *hc*, J. Orledge, Chippenham.

POLANDS—1 and 2, J. Hinton, Warmistone.

BANTAMS—Game—1 and 2, Rev. F. Cooper, Amney Crucis. c. J. May, Southwell, Bristol; E. C. Phillips. *Any other variety*.—1, 2, and *hc*, Rev. F. Cooper.

ANY OTHER DISTINCT BREED—1, J. Hinton. 2 and *hc*, R. C. Forster, Freshford. c. J. S. Maggs.

CROSS BREED—1, J. S. Maggs. 2, D. Colleen, Chippenham. c. J. C. Fry, Marshfield; Mrs. W. A. Large, Cliftonav.

TURKEYS—1, Miss J. Milward. 2, H. Brinkworth, Corsham. *hc*, I. Smith.

GESE—1, G. Hanks. 2, J. Baker, Allington. *hc*, H. Say, Lacey (2). c. R. P. Rich, Chippenham.

DUCKS—Rouen.—1, J. S. Maggs. 2, J. C. Fry. *hc*, G. Hanks; G. M. Hulbert; c. G. Hanks; G. M. Hulbert; J. R. Kodnar, Aidwick Court, Wrington. *Aylesbury*.—1 and 2, G. Hanks. *hc*, J. S. Maggs. *Any other variety*.—1, G. S. Sainsbury. 2, G. Hanks. c. R. J. Fuller, Bremhill.

SWEETSTARE (Game Cock),—1 and *hc*, W. H. Stagg. 2 and 3, G. S. Sainsbury.

Mr. Edward Hewitt, of Birmingham, was the Judge.

OKAHM POULTRY SHOW.

The weather during this Show was unfavourable to the attendance of visitors, as well as to the poultry exhibited, for although it was stated in the printed catalogue that the exhibition was to be held in the Riding School, all except the Pigeons and Bantams, which had the shelter of a large barn, were placed under a large tent, through which the rain penetrated so much as to make it a question whether it was any protection or not. The only difference at first sight was that a portion of the birds were perfectly dry, whilst others were subjected to even a greater downpour than had they been shown without any covering whatever. Tents are never to be depended upon at this season, and we trust that on future occasions an improved plan may be resorted to, as, certainly, the high value of most of the birds shown demanded more favourable quarters. Considerably more than five hundred pens of poultry and Pigeons were in themselves a very good collection; many of our first-rate exhibitors were competing, and the show pen of Messrs. Turner, of Sheffield, left nothing that could be bettered on that head.

It is beyond question that the Rutland Show just held contained by far the best collection of *Cochins* that has ever been seen in the district; Partridge, Buff, and White proving excellent. The *Game* classes were remarkably good, the Brown Red cocks and Ducking Game hens being of far higher merit than usual. Some very well matched Pekin Bantams were shown, and we noticed some first-rate *Malays* and *Silky* fowls. *Turkeys* were far beyond the average, and in the *Duck* classes were to be found contributions from the best breeders in the kingdom. The Selling class was one of more merit by far than usual, a silver cop for the best pen causing first-rate specimens to be entered. It was taken by a well-shown young White Cochins, which will probably again secure similar trophies. *French* fowls were entered in far larger numbers than have been hitherto known in Rutland, and most of them were excellent. It is impossible to give more than a very rough estimate of the *Hamburghs*, as they were so perfectly saturated in some instances that the markings were indistinguishable. The *Pigeons* were a fine collection, and had, as before said, luck on their side, being secure from cold draughts and driving rain. We are assured that the Riding School, or some similar building, will be secured for future *Okahm* shows.

DORRINGS.—Coloured.—Cock.—1 and Cup, C. Speed. 2, E. Wood, Clapton. Thrapsen, J. Hornshy, Grantham; J. Stott, Healey, Rochdale; Marchioness of Exeter, Burghley Park, Stamford; J. Longland, Grendon (2); H. Lingwood, Barking, Needham Market (2); J. M. Wellington, Okahm, c. G. A. Crewe, Etwell, Derby. Hens or Pullets.—1, H. Lingwood. 2, L. Patton, Hillmore, Taunton. *hc*, Lady Aveland, Okahm; J. Hornshy; R. Wood; J. Stott. Silver.—Hens or Pullets.—1, O. E. Cresawell, Hanworth Rectory, Feltham. 2, J. Longland. *hc*, D. E. Campbell, Brentwood, c. Marchioness of Exeter; Mrs. Lowther, Barleythorpe Hall, Okahm. White.—Cock.—1, Miss E. Williams, Henllys Berriew, Montgomeryshire. 2, C. Boye, Kettering. *hc*, Marchioness of Exeter. Hens or Pullets.—1, Miss E. Williams. 2, Marchioness of Exeter, *hc*, Marchioness of Exeter; O. E. Cresawell. SPANISH.—Black.—1, J. F. Dixon, Cotgrave, Nottingham. 2, J. F. Sillitoe, Wolverhampton. *hc*, H. J. Wilkinson, Earby. Chickens.—1 and Cup, J. Boniton, Boreham. 2, J. F. Dixon, Cotgrave, Nottingham. *hc*, H. Yardley, Birmingham; J. F. Sillitoe; H. Walker, Kettering. WOLVERHAMPTON. COCHIN-CHINA.—Cinnamon, Buff, or Partridge.—Cock.—1 and Cup, R. B. Wood, Uttoxeter. 2, T. Rogers, Walsall. *hc*, H. Lingwood; W. A. Taylor, Manchester; C. Sidwick, Ryddesden Hall, Keighley; J. M. Wellington; G. A. Crewe. c. Horace Lingwood, Croeting, Needham Market; H. V. Storey, Lockington, Derby. Hens or Pullets.—1, J. Cattell, Birmingham. 2, W. A. Taylor. *hc*, H. Lingwood; Mrs. Woodcock, Rearsby House, Leicester; H. Lingwood; W. A. Burnell, Kettering; H. Derry, Gedney; J. K. Fowler, Aylesbury; H. V. Storey. c. T. Rogers, Walsall. Black.—Cock.—1, Mrs. A. Williamson, Queenborough Hall, 2, H. H. Bletsoe. 2 and *hc*, Mrs. A. Williamson. Hens or Pullets.—1, H. H. Bletsoe. 2 and *hc*, Mrs. A. Williamson. BRAHMA POOTRA.—Cock.—1, W. Adams, St. Clement, Ipswich. 2, W. T. Storer, Shull Green, Brewood. *hc*, W. A. Taylor. c. J. Thomson, Sheffield; Mrs. A. Williamson. Hens or Pullets.—1, W. Adams. 2, Rev. D. Peake, Laleham Staines. *hc*, Mrs. A. Williamson. FLEMISH FOWLS.—1 and Cup, C. H. Smith, Radcliffe-on-Trent (Crève-Cours), 2, J. K. Fowler (Houdans). 3, W. Dring, Faversham (Houdans). *hc*, J. Maiden, Biggleswade (Crève-Cours); Mrs. J. Cross, Appleby Vicarage, Brig (Crève Cours); R. B. Wood (Houdans); M. Kew (Houdans). c. J. Maiden (Crève-Cours).

HAMBURGH.—Silver-spangled.—1, C. Parsons, Wolverhampton. 2, G. Walters, Worcester. *hc*, J. Wright, Melton Mowbray. Silver-penciled.—1, T. Hambleton, Keighley. 2, W. Golly, c. Co., Duhb, Bingley. Gold-spangled.—1 and Cup, T. Hambleton, Tottenham. 2, W. Golly, c. Co., Duhb, Bingley. *hc*, W. K. Tickner, Ipswich; L. Wren, Lowestoft. Golden-Cuckoo.—1, R. R. Parker, Ipswich. 2, W. K. Tickner. *hc*, A. Coles, Long Sutton, Wisbeach. c. H. Marriott, Skirbeck, Boston.

GAME.—Red and other Dark Colour.—Cock.—1, W. Adams. 2, A. J. Flyder, *hc*, A. J. Flyder; F. Bell, Burton-on-Trent; S. Matthew, Stowmarket. c. T. H. Heafford, Melton Mowbray; G. Heafford, Loughborough (2). Hens or Pullets.—1, G. Heafford. 2, W. J. Jones, Barleythorpe Hall. *hc*, Messrs. Collyer and Co., T. Whitaker, W. J. Jones, Barleythorpe Hall. *hc*, Messrs. Collyer and Co., T. Garton, Okahm. White Piles, and Light Colour.—Cock.—1, S. Matthew. 2, E. Winwood, Worcester. *hc*, T. Whitaker; G. Heafford; J. Jekin. Hens or Pullets.—1 and Cup, S. Matthew. 2, E. Winwood.

BANTAMS.—White, clean legs.—1, B. Painter, Burley-on-the-Hill. c. S. & R. Ashton, Mottrick; H. L. Bradshaw, Wakerley, Stamford. Black, clean legs.—1 and Cup, S. M. Storer, Long Sutton. 2 and *hc*, E. Ashton. Gold or Silver-laced.—1, H. Draycott, Hambro, 2 and *hc*, H. H. Bletsoe. *hc*, Mrs. M. Finch. Any other Variety.—1, B. S. Lowndes, Stony Stratford (Pekin Bantams). *hc*, Mrs. Woodcock, Leicester. 2, E. Winwood, Worcester (White-bodied Bantams). H. S. Moscrop. 2, G. Hall, Kendal. *hc*, T. Whitaker, Melton Mowbray; Rev. E. S. Toddman, Childerley Vicarage, Brentwood; W. Knight, Maplebeck, Newark; W. C. E. Newbitt, Epworth; F. H. Jones, Fulham. c. E. Barker, Stokely. Hens or Pullets.—1, B. S. Lowndes, Stony Stratford; H. H. Bletsoe, c. J. Jekin, Pagnell. *hc*, Rev. E. S. Toddman. 2, H. C. Rogers, Newport. 3, J. G. Jeffrey. c. J. Smith, E. Lingley Hill, Southwell; H. Ashmore, Brimington, Chesterfield; J. M. Wellington, Okahm.

POLANDS.—1, G. W. Boothby, Louth. *hc*, A. Almond, Oakham. c. A. Almond; M. Kew.

ANY OTHER VARIETY.—1, M. Kew (Malays). 2, Miss E. J. N. Hawker, Turleigh, Tadbrough Wells (Japanese Silkies). TURKEY.—Old Bush.—Cock.—1 and Cup, G. R. Pearson, Witham Common, Grantham. 2, L. Patton, Hillmore, Taunton. *hc*, G. R. Pearson; — Hughes; F. E. Richardson; M. Kew; Misses G. & L. Traish, Potheringham, Oundle; Mrs. A. Guy, Eaton, Grantham; E. Leech, Rochdale, c. F. Palmer; Marchioness of Exeter. Hens.—1, Mrs. A. Guy. 2, G. R. Pearson, *hc*, L. Patton; M. Kew. c. F. Palmer; E. J. Richardson, Bramshall, Uttoxeter. Young Birds.—Cock.—1, Mrs. A. Mayhew, Great Baddow. 2, G. R. Pearson. *hc*, W. Hughes; Mrs. A. Guy. c. G. R. Pearson; E. Leech. Hens.—1, G. R. Pearson. 2, F. Leech. *hc*, L. Patton; W. Hughes.

DUCKS.—White Aylesbury.—1, Mrs. C. P. E. Leech. 2, Mrs. M. Seamons, Aylesbury. *hc*, Mrs. M. Seamons; S. Deacon, jun., Polebrook Hall, Oundle; J. K. Fowler, Aylesbury; H. H. Bletsoe. c. G. H. Finch, M.P. (3). Rouen.—1, J. W. White, Netherton. 2, Mrs. M. Seamons. *hc*, L. Patton; J. W. White; J. Dickinson, Leigh, Manchester. c. R. Wood. Any other Variety.—1, Mrs. Louthers (East Indian). 2, H. H. Bletsoe, Barwell, Oundle (Wild). *hc*, S. H. Stott; H. C. Deacon, jun. (East Indian). White Peruvians. c. M. Kew (Buenos Ayres); S. Deacon, jun. (East Indian). Cross-bred or Common.—Young.—1 and *hc*, C. J. Bradshaw. 2, G. R. Pearson.

GESE.—Pure White.—1 and Cup, Mrs. M. Seamons. *hc*, E. Leech. Goslings.—1, J. K. Fowler. *hc*, G. H. Finch, M.P. (2). Grey.—1, Rev. C. H. Lucas, Edith Weston, Stamford. *hc*, M. Kew. c. S. H. Stott; E. Leech. Goslings.—1, E. Leech. *hc*, J. K. Fowler. c. Rev. C. H. Lucas; S. Deacon, jun. SELLING CLASS.—1 and Cup, T. Rogers, Walsall. 2, J. F. Sillitoe, Wolverhampton (Spanish Cocks). *hc*, J. Longland, Grendon, Northampton (Dorking Pullets); W. B. Jeffries (Bantam); G. Boye, Kettering (Dorkings); Mrs. Burridge, Burley-on-the-Hill (Ira Fowls); J. K. Fowler (Aylesbury Ducks). c. J. F. Sillitoe (Spanish Cocks); W. Dring (Crève-Cours); J. M. Wellington (Black-breasted Reds); L. Wren, Lowestoft (Golden-spangled Hamburgh Cocks); W. A. Burnell (Buff Cochins Pullets); G. A. Crewe (Partridge Cochins).

LOCAL CLASSES.

DORRINGS.—Chickens.—*hc*, C. Speed, Exton; G. H. Finch, M.P., Burley-on-the-Hill. GAME.—Chickens.—Cup, A. J. Flyder, Aylesbury Hall Uppingham. FARMYARD.—Chickens.—1 and 2, M. Kew. 3, B. Painter, Burley-on-the-Hill.

PIGEONS.

TOMBELERS.—1, H. Yardley, Birmingham. 2, P. H. Jones, Folham. *hc*, G. Brentland, Burton-on-Trent. c. H. Headley. CARRIERS.—1 and 2, E. Walker, Leicester. c. H. Yardley. POUTERS.—1, W. R. Rose, Kettering. 2, E. Walker. *hc*, R. F. Payling, Peterborough. JOHNS.—1 and 2, H. Headley, Thurmaston, Leicester. CANTAILS.—1, J. F. Lovelace, Newark-on-Trent. 2, F. H. Paget, Birkstall, Leicester. *hc*, H. Vaughan, Wolverhampton; P. H. Jones, Folham. c. H. Yardley, Birmingham. TRUMPETERS.—1, Withheld. 2, W. Gamble, Thorpe Satchville, Melton. NUNCS.—1, P. H. Jones. 2, H. Vaughan. *hc*, W. E. Easton, Hull. c. A. B. Bagley, Shooter's Hill, Longton. SHARPS.—1, P. H. Jones. 2, W. E. Easton. *hc*, O. E. Cresawell; F. H. Paget. c. A. B. Bagley. KENTS.—1, H. Yardley. 2, T. D. Green, Safron Walden. c. H. Yardley; P. H. Jones. ANY OTHER VARIETY.—1, H. Yardley. 2 and c. F. H. Paget. *hc*, H. Headley (Labels).

The Judges were Mr. Hewitt and Mr. Tegetmeier,

NORTHAMPTON ORNITHOLOGICAL SOCIETY

This Society's Show of Canaries, British birds, and Pigeons, was held November 26th and 28th. The following are the awards:—

PIGEONS.—Three of Distinct Varieties.—1 and Cup, Mrs. Hall, Northampton. 2, W. Nottage, Northampton. c. T. Chambers. Pouters or Carriers.—1 and c. T. Chambers, jun., Northampton. 2, T. Adams, Northampton. *hc*, B. B. Farber, Northampton. 1, W. Morbey. 2, W. Nottage. *hc*, C. Tassell, Northampton. Orls, Turbits, or Jacobins.—1, W. Morbey, Northampton. 2, W. Lepper, Northampton. *hc*, F. Farber, Northampton; W. Lepper. Any other Variety.—1, W. Lepper. 2, W. Morbey. *hc*, Green, Northampton.

CANARIES.

NEWBORN.—Clear Jonque.—1, T. Irons, Northampton. 2, Moore & Wynne, Northampton. *hc*, T. Mann, Cannewell New Road; Bemrose & Orme, Derby. *hc*, T. Irons; G. Gayton, Northampton; W. Gamble, Northampton. c. S. Bunting, Derby; Moore & Wynne (2). Clear Mealy.—1, Moore & Wynne. 2, Bemrose & Orme. *hc*, S. Bunting; Chapman. *hc*, Moore & Wynne; Bemrose & Orme. c. G. Clifton, Northampton; Moore & Wynne. Equal 2, R. Hawley, Derby. Evenly-marked Jonque.—1, W. Gamble. 2, T. Irons, Northampton. *hc*, Bemrose & Orme, H. A. Apled, Worthing; J. Bexson, Derby. c. S. Bunting; T. Irons. Evenly-marked Mealy.—1, Moore & Wynne. 2, G. Gayton. *hc*, Moore & Wynne; Bemrose & Orme. *hc*, W. Gamble. c. H. Apled; J. Bexson.

NEWBORN.—Ticked or Unevenly-marked Jonque.—1, Bemrose & Orme. 2 and *hc*, Moore & Wynne. *hc*, T. Mann; R. Hawman; c. H. Apled; T. Irons. *hc*, Bemrose & Wynne; Bemrose & Orme. *hc*, H. Apled; W. Gamble.

NEWBORN.—Any variety of Crested Jonque.—1, R. Hawman. 2, T. Irons. *hc*, Moore & Wynne; T. Irons. *hc*, Moore & Wynne; W. Barwell, Northampton. c. J. Turner, Birmingham; G. Smith, Northampton. Any variety of Crested Buff.—1, T. Irons. 2, J. Turner. *hc*, S. Bunting; T. Irons. *hc*, Cox; T. Irons. c. W. Holmes, Nottingham; — Hyllier.

NEWBORN.—Clear Yellow.—1, J. Turner. 2, J. N. Harrison, Belper. *hc*, S. Spinke, Chippenham; J. N. Harrison. c. W. Neidler, Hull; J. Close, Derby. *hc*, S. Spinke. 1, J. Turner. 2, W. Bexson. *hc*, S. Spinke (2). *hc*, J. N. Harrison. Marked or Variegated.—1, J. Turner. 2, S. Spinke. *hc*, S. Bunting. c. J. N. Harrison.

LIZARDS.—Golden-spangled.—1, T. W. Fairbairn, Canterbury. 2, G. Tuckwood, Northampton. *hc*, J. N. Harrison; Stevens & Burton, Middlesbrough. *hc*, T. W. Fairbairn; H. Ashton, Polefield Hall, Prestwick. c. Stevens and Burton. H. Hawman, Silver-spangled.—1, H. Ashton. 3, Stevens & Burton. *hc*, R. Hawman; Stevens & Burton. *hc*, S. Bunting. c. G. Tuckwood; J. N. Harrison.

CINNAMON.—Jonque.—1, 2, and *hc*, T. Irons. *hc*, — Tomes; S. Bunting; G. Clifton. c. Moore & Wynne; H. Apled. Buff.—1 and *hc*, T. Irons. 2, W. Gamble. *hc*, H. Apled; — Tear, Northampton. c. W. Gamble; H. Apled. Marked or Variegated.—1, Stevens & Burton; 2 and c. Moore & Wynne. *hc*, — Tomes.

ANY OTHER VARIETY.—1, H. Ashton. 2, A. Webster, Kirkstall, Leeds. *hc*, G. Gayton; W. Hutton, Baidon. *hc*, W. Holmes; — Tear, Northampton; W. Hutton. c. Stevens & Burton; H. Ashton.

GOLDFINCH MULE.—Jonque.—1 and 2, B. Ashton. *hc*, Stevens & Burton; W. L. Chapman; W. Neidler. Mealy.—1, Fairclough & Howe. 2, S. Bunting. *hc*, W. C. Burniston, Middlesbrough; S. Bunting. *hc*, H. Ashton (2). c. W. Neidler; W. L. Chapman. Dark.—1, Moore & Wynne. 2, Cox. *hc*, Stevens & Burton; Moore & Wynne. *hc*, W. Cattell, Northampton; A. Webster; W. L. Chapman. c. Cox; — Hyllier.

GOLDFINCH.—I, Fairclough & Howe, vnc. J. N. Harrison; Stevens & Burton, nc. W. King, Wellingborough. c. Moore & Wynne; — Knibb.
BULLFINCH.—J. W. & C. Barniston, vnc. F. Haddon, Northampton; Fryer and McCrae, Stockton. nc. Moore & Wynne. c. A. Webster.
JUDGE.—Mr. W. Wilmore, London.

EGG-EATING BEES.

THE fact of bees eating or removing eggs from their combs when queens are being reared artificially, as described by your correspondent "R. S." in page 383, has been noticed by me for a number of years, and I once sent an article on the subject to the Journal, but for some reason it never appeared. I have, however, experimented much both before and since on this point, and may here describe under what circumstances I have found the egg-eating propensity become manifest, and show also how I have cured it. Like "R. S.," I am prepared to say that it often happens, but I do not believe that it occurs in every instance.

Many bee-keepers, I doubt not, have noticed during spring the case of a formerly-proven fertile queen where the hive in which she is regnant makes no progress, no young bees appearing, and yet if this queen were transferred to another hive it would at once become prosperous. When I made this discovery I noticed that in such dwindling hives where they had taken to egg-eating the bees were invariably old. Knowing, therefore, the fact that if the queen were transferred to another hive her progeny would be matured, I tried the experiment of inserting a frame of brood in the heart of the hive; this had the desired result and acted like a charm, and I have often since repeated the experiment with success. Subsequently, when I discovered that eggs and larvæ were eaten by the bees when raising queens, I conjectured and was about to affirm that bees required eggs or larvæ for the production of royal jelly, but I exploded this idea, having found from further experiments that many destroyed not a single egg.

Although I am satisfied that eggs are not invariably destroyed, still the mystery is far from being solved. I may, however, be allowed to ask the question, What is the reason that old bees devour eggs and that young ones do not? Can it be owing to their stomachs? We know there is a difference in the stomachs of the old and young of some animals; can there then be an inability in the stomach of the old bee to produce royal jelly? and is that organ in the young bee, whose duty it appears to be to become a nurse when but a few hours old, capable of producing a different compound from that of old ones?—A LANARKSHIRE BEE-KEEPER.

BEEES BREEDING LATE.

YESTERDAY, November 30th, being a very warm and fine day, my bees all turned out in numbers, and upon inspecting one of the hives I was astonished to see a number of young bees before the entrance, evidently just come out of their cells. Now you will allow this is rather an unusual time of year for young bees—either exceedingly early or very late, and as there is no chance of there being any pollen for two months at least, I wish to know what will become of any grubs there may be in the cells, and whether there is any means of providing artificial pollen, such as meal, what is the best way to give it to them, and the best to use?—CAROLUS.

[Your bees have been breeding late in the season, but this circumstance is not so remarkable as you appear to imagine. Young bees (Ligurians) were taking wing for the first time in considerable numbers from one of our own hives five days later than in your case, whilst pollen was being carried into others at the same time. You need not apprehend any failure in the supply of the last-mentioned substance, which we have always found bees able to accumulate in excess of their actual requirements.]

OUR LETTER BOX.

NOTICE.—Most of our authorities are at Birmingham, so that we must defer answering many poultry queries until our next number.

HAMBURGH (S. D. C.).—It is pronounced as if spelt "Hamborough." A dark pullet, though lighter-plumaged this season, is not unlikely to produce dark chickens next year. We do not know anything about the preferences you name.

BLACK-BREADED RED GAME MOULTING UNTRUE TO COLOUR Puzled One).—It is not very uncommon for a bird to moult as you describe yours to have done. If you exhibit, he is still fit to show in the class for "Black-breasted and other Reds." He will not do for Black-breasted Reds. He is now a Brown Red, but not less valuable. There is a stain in him to which he has thrown back.

FEEDING BRAHMAS FOR EXHIBITION (A Duffr).—We like your feeding

better than the advice of your friends. If your fowls have good constitutions do not destroy them with physic. Give them ground oats slaked with milk in the morning, a little barley or maize at midday, and ground oats again in the evening; add thereto some table scraps daily, and some heavy sods of growing grass cut with plenty of fresh mould. Give as much lettuce as you please. You need do nothing more.

FEEDING POULTRY (Poultry Food).—Ground oats are excellent food, but not essential to the well-doing of fowls. Feed as we have advised in our preceding answer, substituting barley meal for ground oats. (A Ten-years Subscriber).—It is almost impossible to name any quantity of food for a given number of poultry. Your food is not good; instead of Indian corn meal, give ground oats, which in Ireland you should get cheaper. The Ducks should be fed on oats, the Turkeys on meal mixed with milk. It will always be difficult to fatten chickens, Ducks, or Turkeys brought from cottagers, as they are so poorly fed. As a rule, that which is necessary for the formation of the fat, is for a long time absorbed in the production of flesh. We advise you to let all the chickens run at liberty, to shut up the Turkeys in a small shed where they can be fed from a trough with fo-d made of oatmeal slaked with milk; but they must be put up as they are likely to be wanted, two or three at a time. The Ducks should be shut up in an old pig-sty or similar place, and fed on oats put in a trough with water. You must recollect birds cannot be kept artificially fattened in a state of confinement. They will lose flesh and die. We advise you to shut up only Ducks and Turkeys. Feed the chickens as well as you can at liberty. You will never get eggs in the winter by keeping hens, you must have pullets for that purpose. Birds will starve to death on one food, however good it may be. They must have change. Most poultry women waste half the food by throwing down the same quantity in the same place every day without reference to circumstances. To throw down food, is not to feed. When the first is only partly eaten, the second should not be given. Fowls do not like Indian meal, nor is it profitable food. It would be a much better arrangement for the poultry woman to buy her own food. In a large family the scraps, properly managed, should play an important part in feeding the birds, and lessening the expense.

EXHIBITING SPANISH FOWLS—COCHIN UNTHRIVING (Scotus).—The small defect in the face of your Spanish cock being an accident, and bearing the proof of it, will not be a disqualification. It is only a disadvantage, and not a serious one. The White Cochins are unwell. He must be thoroughly purged with castor oil, a table-spoonful every day till his evacuations, which are, doubtless, now green and watery, become figured and brown and white. If after some days' purging this does not take place, try Baily's pills, and add to them two pills of camphor, each the size of a garden pea. These may be given with castor oil, allowing two hours between the oil and camphor. If benefit show itself, the dose of camphor may be increased.

FATTENING FOWLS FOR TABLE (N. C.).—Cramming is unnecessary, unless it is desired to make fowls fit for the London market. Fowls can be kept fat enough for table when running about, and always are so in a good farmyard; but where all the food has to be bought it is very expensive to feed all alike. The birds intended for the table should be shut up in a fattening coop, and fed three times per day with ground oats or barley meal mixed with milk. The process is too long to be described here, you will find it at length in "Fowls," by Baily. In that work there is a chapter devoted to it.

PIGEONS AND CHAFFINCH (E. S. Polkinghorne).—Your Pigeons have roun; we gave the most likely means of cure in our number for November 17th. A great number of articles appeared in this Journal in the early part of this year about Flying Tumblers and Birmingham Rollers, and more, alas! was said of them than was true, both as to length of flight and supposed delicacy. In the words of Mr Breat, "Flying Tumblers give less trouble in breeding than any other variety of Pigeon, where any pretension to fancy is desired." In the long articles we printed the subject was exhausted. The tauneness of your Chaffinch is as pleasing as it is unusual.

FISH IN GLASS GLOBE (H. H.).—Give them a little raw meat shredded very fine every day. Vallisneria spiralis, Rannunculus aquatilis, and Apongetoo distachyon are plants you might grow in the globe.

PICKLED MUSHROOMS—"C. Y." has pickled mushrooms; all turned black. She wishes to know how this is caused and to be avoided.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending November 29th.

- 23.—Foggy; very fine; fine, starlight.
- 24.—Boisterous; very fine; drizzling rain.
- 25.—Clear and fine; cloudy; fine starlight.
- 26.—Dense fog; very fine; dense fog.
- 27.—Cloudy but fine; very fine; dense fog.
- 28.—Foggy; dense fog; densely overcast.
- 29.—Densely overcast; overcast; densely overcast.

COVENT GARDEN MARKET.—NOVEMBER 30.

THERE has been a limited attendance of buyers during the week, and a general dullness prevails. Hothouse Grapes are good and plentiful, comprising Black Hamburgs, Alicante, Lady Down's, and Muscats, Pines are as plentiful as they were scarce at the beginning of the month, and prices are receding. Large supplies of Potatoes have come to hand both coastwise and by rail.

From observations taken near London during the last forty-three years, the average day temperature of the week is 47.1, and its night temperature 34.5. The greatest heat was 63°, on the 11th, 1841; and the lowest cold 13°, on the 8th and 19th, 1867. The greatest fall of rain was 1.92 inch.

PRUNING ORNAMENTAL TREES AND SHRUBS.

No. 6.

PRUNING being subsequent to planting, I purpose at this stage to offer to the notice of intending planters some suggestions on the distribution of trees and shrubs in parks and pleasure grounds.

The best and the true mode of arranging trees, shrubs, and other plants so as to produce effect is, without dispute, massing them. Art may dispose them in lines and a variety of ways that will result in a good effect, but

though art is essential it will ever prove abortive if not founded on those broad, well-defined principles that give art its life. The ideal of the painter is Nature. If his picture has not Nature it will never immortalise him, and the planter disposing plants in a confused manner will have a very confused, undefined landscape. Some have an idea that the best effect is attained by a promiscuous assemblage of the different species and varieties of trees, shrubs, and other plants. Probably acting on what they consider Nature's disposition, at irregular distances and in an irregular style, a great diversity of plants are placed in a manner which is in no way superior to a confused distribution that in the end must produce a bad effect. This is termed imitating Nature. As a mixture the planting may be all very well; it may serve every purpose of shelter, and afford the gratification trees and shrubs with their allies always give, but it has nothing of Nature, for in this the trees, &c., form objects in the landscape; there are masses of evergreens in one spot, and masses of deciduous subjects in another, the whole having varied gradations of height, depth, and size; uniformity is nowhere apparent, and yet the whole is blended into one scene or picture, though composed of several parts or objects individually well marked and distinct, yet bearing a correlation to each other, producing in effect that harmony and contrast most pleasing to the eye.

Nature's principle of planting is in masses. In no case is Oak intermixed with Ash, much less do we find a clump of Pines mingled with Elms. The soil, situation, and climate give a degree of fitness for a certain class of plants in one place, and for a very different kind in another; hence we have that distinctness of view with diversity of features always pleasing to the eye, and a completeness that characterises Nature's works, showing them different from art or the work of man. Though in the best examples of natural scenery there is seldom the solitary tree, yet there is a very great difference in the subjects forming the landscape. A mass of Oak prevails in one place, there is Ash or Elm in another, Pines surmount the eminences, Gorse will show itself here and there, the Willow will be where there is water, the Dog-wood and Guelder Rose in moist situations, and in all there are masses of some particular tree; not that there are no detached specimens and small groups, but they seem rather as having escaped from the main groups, forming connecting links between the latter and what they

adjoin, than as being characteristic of Nature's disposition of plants.

I will not further note Nature's distribution of plants. It has been pooh-poohed in our gardens, but what would be said if we were to mix our flowering plants in beds and borders in a style like that we adopt in ninety-nine out of every hundred plantations of trees that are formed in this country? Supposing we arrange our plants in a bed or border one or more of each kind, having due regard to height and colour both of bloom and foliage, striving to make a bed as much mixed or diversified as possible, what will be the result? A fine bed it may be as regards foliage and flowers, but the effect is poor. What a different effect would have been produced had all the plants of one hue of flower or foliage been disposed in a mass! The parts then become distinct—a feature in itself, though it comprises but a part of the bed or border, yet combining with the other parts to form a whole. It is the same with trees, though on a larger scale; the mixed system must give place to the massing or natural system.

In planting trees and shrubs on the massing principle groups may be formed of one species or variety of tree, or very effective groups may be formed of a species and its varieties, and finer still when the most distinct species of a genus are collected into a group; in no case mixing them promiscuously, but disposing each in a mass, so as to show its character, and by dotting a few on the margin of the group, yet near enough to form or appear a part of the group at a distance, though on close inspection they have the characteristics of the isolated tree. In this way we secure the beauty of the specimen as well as that of the mass. The dotting will also serve to break the not unfrequently monotonous smoothness of artificial outlines.

The groups may comprise any number of parts—in extensive arrangements be large enough to contain examples of every species and variety of a genus; but very effective groups may be formed of a few of the most distinct kinds.

Let us suppose *a* to be a group intended for three species or kinds. Oaks are desired. In this case—*a*, Turkey Oak (*Quercus Cerris*); *b*, English Oak (*Quercus pedunculata*); *c*, Scarlet Oak (*Quercus coccinea*); whilst for dotting on the margin the same kinds may be employed as those in the mass adjoining; or *e* may be the variegated Lucombe Oak (*Quercus Cerris Lucombeana variegata argentea*); *d*, Lucombe Oak (*Quercus Cerris Lucombeana*); *f*, Fern-leaved variety of the English Oak (*Quercus pedunculata asplenifolia*); *g*, Variegated English Oak (*Quercus pedunculata variegata*); *h*, Cork Oak (*Quercus Suber*); *i*, Evergreen Oak (*Quercus Ilex*).

In a similar way with Chestnuts, *a*, may be the common Horse Chestnut (*Aesculus Hippocastanum*); *b*, Pink Horse Chestnut (*Aesculus H. carneum*); *c*, Scarlet Horse Chestnut (*Aesculus H. coccineum*); whilst *d* could be the Variegated (*Aesculus H. variegatum argenteum*); *e*, Double White Horse Chestnut (*Aesculus H. flore-pleno albo*); *f*, Double Red (*Aesculus H. flore-pleno rubro*); *g*, *Aesculus H. præcox*; *h*, *Aesculus H. crispum*; *i*, *Aesculus rubicandus*.

In a similar way it might be planted with Elms, Limes,

Maples, &c., and so on to evergreens: for instance Pines, *a*, Austrian (*Pinus austriaca*); *b*, *Pinus excelsa* or Weymouth (*Pinus Strobus*); *c*, Corsican (*Pinus Laricio*), or Scotch (*Pinus sylvestris*); and *d*, *Pinus Cembra*; *e*, *Pinus Benthamiana*; *f*, *Pinus macrocarpa*; *g*, *Pinus Lambertiana*; *h*, *Pinus Jeffreyi*; and *i*, *Pinus pyrenaica*.

Spruce Firs form an imposing group; as *a*, Norway Spruce (*Abies excelsa*); *b*, Douglas (*Abies Douglasii*); *c*, White Spruce (*Abies alba*); then *d*, *Abies excelsa elegans*; *e*, Hemlock Spruce (*Abies canadensis*); *f*, *Abies Menziesii*; *g*, *Abies orientalis*; *h*, *Abies Douglasii taxifolia*; *i*, *Abies Hookeriana*.

Silver Fir would be even finer. *a*, *Picea Frazerii*; *b*, *Picea peetinifolia*; *c*, *Picea lasamea*; and *d*, *Picea Nordmanniana*; *e*, *Picea cephalonica*; *f*, *Picea nobilis*; *g*, *Picea Pinsapo*; *h*, *Picea grandis*; and *i*, *Picea magnifica*.

If not convenient to have groups of one genus, very effective masses would be formed by planting different species or varieties of several genera. For instance, 1 may be composed of Beech; 2, Scotch Fir; 3, White American Spruce; 4, Scarlet Oak; 5, Scotch Elm; 6, Scarlet Maple; 7, Lime; 8, Austrian Pine; 9, Sycamore; 10, Horse Chestnut; and for dotting, *d*, Purple Beech; *e*, Turkey Oak; *f*, Scarlet Horse Chestnut; *g*, Variegated Sycamore; *h*, Variegated Maple; *i*, Exeter Elm.

In case it were near the pleasure grounds it might be desirable to employ shrubs, then 1 may be *Cupressus Lawsoniana*; 2, common Holly, with Mountain Ash interspersed among the Hollies at about 15 feet apart; 3, Portugal Laurel; 4, English Yew; 5, *Laurustinus*, with a few *Laburnums* at the back and interspersed; 6, *Thujopsis borealis*; 7, *Coldie Laurel*, with Bird Cherry interspersed; 8, *Rhus Cotinus*, with *Berberis Aquifolium* and *B. Darwinii* in masses in front, or just within the margin; 9, Lilacs, with a mass of tree Box at the right-hand corner; 10, *Thuja Lobbi*; and *c*, *Scarlet Thorns*; *d*, *Double Gorse*; *f*, *Salisburia adiantifolia*; *g*, *Double White Thorns*; *h*, *Tulip tree*; *i*, *Scarlet Thorns*.

The above may not be the best modes of arrangement, nor are they given as such, but any mode of planting is better than a confused one; they may lead to better modes of planting in future, for I cannot perceive anything more at variance with our ideas of the beautiful than what we meet with in nearly all parks adjoining pleasure grounds in the three kingdoms.—G. ABBEY.

THE PINE APPLE.

THE summer of 1870 has been one of the very best, in my experience, for the cultivation and fruiting of the Pine Apple; so, too, was that of 1868. We can and have done much by artificial means, but we cannot compete with Nature. The fruits have not only swelled better but the flavon is richer; in some instances the juice was dropping from the fruit before cutting. This took place in June and July. I have cut several Queens of 1 lbs. in weight and one Queen of 6 lbs., and with crowns 2 to 3 inches long. I have not had such a glut as in some seasons. I cut the first fruit in March, and the others have come in two and three a-month ever since. I had two

or three Smooth Cayennes, one of 4 lbs., the other of 5 lbs., but the last-named had a crown 8 inches long. Thirty plants were put into our fruiting Pine stove in August, 1869, being then twelve months old, and, as stated above, the first fruit ripened in March, 1870. I have cut twenty-four Queens and two Smooth Cayennes. Four Queens are now, while I write, November 28th, swelling off. It will, therefore, be observed that the first fruit cut was in nineteen months, and it weighed 4 lbs. The fruit, which weighed 6 lbs., was cut November 5th from a plant two years and three months old, and by far the finest plant in the house; it fruited in a 13-inch pot. I had ten plants in 13-inch pots, and twenty plants in 11-inch pots. Those in 11-inch pots, with the exception of that which bore the 6-lbs. fruit, gave, if anything, larger fruits; though at the time of potting, of course the largest plants were potted in the 13-inch pots. Nothing has been gained in the above instance by large pots.

Will some others give their experience? I shall be very glad to hear what has been the heaviest Old Queen ever ripened. I am aware there are several varieties of Queens; some produce larger fruits than the Old Queen, but none equal it in flavour. I shall also be glad to know the size of crown, as I have seen fruits shown with crowns more than a foot long. This, I consider, ought at all times to be stated when weight is given; then we can form an idea of what the produce is like. To those who have fruit with large crowns let me say—Moderate your top and bottom temperatures, place your plants near the glass, give abundance of light and air; then less crowns will be the result.—C. M. McC.

FITZROYA PATAGONICA.

SINCE the introduction of the above species of Conifer into this country a few years ago I have not heard anything about it. If I remember rightly it was reported as growing in its native country to the height of 70 or 80 feet, and if it is ever likely to attain that height in England, those who planted it on its introduction will by this time be able to form an opinion.

I have planted it in both light and heavy soils, in sheltered and in exposed situations, and the conclusions I have drawn from its appearance have not been favourable to its ever becoming a popular tree in this country; and after four years' trial I could not see any sign of its ever reaching even 10 feet high. The plants remained in perfect health, but they did not increase in height more than 1 inch per year. The side branches, however, made better use of their time, as they grew twice as fast as the leader; but they were so slender as not to be able to support themselves, and the whole plant presented such a shabby appearance and its habit was so straggling as to lead me to conclude it was not worth growing. I may, however, be mistaken, and if any correspondent has succeeded in growing it into anything like a specimen, a few details respecting its treatment will, I feel sure, be acceptable to many others as well as to—THOMAS RECORD, *Hatfield Park*.

A VERMIFUGE NOT OFTEN OBTAINABLE.

THE place in which I lived before the present I had to lock after the farm. A distillery being connected with the place, and there being more wash than the cattle could use, we had it brought to the grazing fields, and emptied over them as liquid manure. Next morning Mr. P.— and I were passing that way, when there were so many worms dead that Mr. P.— exclaimed, "Is it not wonderful how it kills the worms?" Had he been that way a fortnight after he might have said, "Is it not wonderful how it makes the grass grow?"—W. W., *Gardener, Adamstown Glebe*.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 8.

DRAWING PLANS.

IT is unnecessary to give any more examples of single figures; the foregoing, well understood, will be found sufficient to lead on those whose education has not enabled them to understand the theory and practice of geometrical drawing, and will enable them to design and execute other figures, also to transfer them from paper to the ground. Perseverance alone is required.

The beginner must not be satisfied with his work if it is only "nearly" right; he should try again and again with increased care, and success will soon attend his efforts. It is evident that the foregoing figures would be of comparatively little use without some definite method for their arrangement in groups, &c.

The mode described of transferring a single bed to the ground will not be found sufficient for the transference of a well-designed plan. To transfer intricate designs to the ground it is necessary to find the principal points to work from, and other points of reference, which will be explained practically by aid of the following directions more clearly than by any number of mere descriptive words.

Figs. 29 and 30 are more difficult either to draw on paper or to trace upon the ground than any other of the foregoing examples, but when once the method and practice are clearly understood, difficulties that before appeared as mountains to the uninitiated will soon pass away.

Fig. 31 is the first example composed of a number of beds, and constituting a complete design. From the figures and instructions already given it will be obvious to any person how to draw the design on paper, but how to transfer it to the ground is not so easily understood without some practice. Before beginning to trace a design on the ground, it is necessary to be provided with a line, and two or three pieces of string (whip cord is the best) to use for finding certain points; also some stakes about 10 or 12 inches long, and about 1 inch thick, some pegs 5 or 6 inches long of about the same thickness, and a measuring tape.

To transfer the design to the ground, draw line *A B*, which is 42 feet 6 inches long; describe the square *ABCD* as in fig. 7 (page 344); draw the diameter lines *B R* and *C H*, also the diagonal lines *A C* and *B D*; draw the inside square, allowing 4 feet for the width of the beds; divide the square as in *g g*, leaving 3 feet for an entrance. From centre *o* draw circle *r*, also circles *s* and *t*, as shown by the entire and dotted lines, then draw the four angular beds as shown.

To transfer the design to the ground it is necessary to have the scale at the foot of the plan, or, better still, to have a rule with the scale marked upon it. It is also necessary to have the ground prepared as before described. Insert a stake firmly at point *A*; get a line with a loop at one end, and drop the loop over the stake in point *A*. Stretch the line straight along, say to the length of 50 feet; fix the line there by means of a peg; with the measuring tape from stake *A* measure 42 feet 6 inches on the line to *B*. Insert a stake at point *B*. Lay line *B C* at right angles with line *A B*, which is done in the following manner:—From the stake at point *B* on each side measure any two equal distances, as *f f*; insert a peg at each point; get a string with a loop at one end, drop the loop round one of the pegs, take the other end of the string toward *c*, double the string round a peg, and trace an arc as in *n*. Shift the loop to the other peg, and with the same length of string trace an arc cutting the former one; where the two arcs cut each other is exactly

perpendicular to stake *B*. Lay the line from stake *B* to point *n*, measure 42 feet 6 inches along the line from stake *B*, and insert a stake as at point *c*; get the string and drop the loop round the stake in point *A*, measure 42 feet 6 inches on the string, which is the length of the side. With the radius of 42 feet 6 inches trace an arc as in point *n*; shift the loop to stake *c*, and with the same radius trace another arc, cutting the former one. Where the two arcs cut each other insert a stake as at point *n*, lay the line from stake *c* to stake *n*, and from stake *n* to stake *A*, which is the starting point. Then lay a line from stake *A* to stake *c*, and from stake *B* to stake *D*. These are called diagonal lines; if these two lines are of equal length the square is perfect; if not, it must be made so before proceeding further.

If the lines on the ground do not correspond with the lines on the paper, the plan is of little use; it will only be a guide, and not a working plan, and when traced on the ground it will be found the design is crippled and entirely unsatisfactory.

If the diagonal lines are equal, lay the middle or diameter

Fig. 31.

lines *B R* and *C H*; where these lines cross each other is the centre *o*. The outside beds are 4 feet wide, according to scale; these are the four corner beds and the four oblong beds. From the stake at point *A* on each side measure 4 feet, and in each point insert a peg as at *e, e*; from each peg measure 4 feet inwards, meeting on the diagonal line; there insert a stake, which is the inner angle of the bed. Find the corresponding points in the same manner. The inside lines can be found by measuring 4 feet on each side of stakes *B C D* in the same manner as from stake *A*. Lay lines, as from *c* to *d*, and from *e* to *g*; where the lines cross each other are the inner angles of

the four corner beds; insert a stake at each point, and lay a line from stake to stake. From stake *A* on the line towards *E* measure 11 feet 6 inches. Insert a peg as at point *a*; from the last peg measure 3 feet on the same line, and insert a peg as at *h*; from peg *h* measure 13 feet 6 inches, and insert a peg as at point *m*; from the peg at point *m* measure 3 feet, and insert a peg as at point *n*; find the corresponding points on line *A* and *B*, also on line *B* and *C*, and on line *C* and *D*, then lay lines between pegs *a a, h h, m m, n n, b b, r r, s s, and t t*. Thus the eight outside beds are lined, and can be cut out. Insert a stake in centre *o*, with a string 9 feet 6 inches long, trace a circle as shown by the dotted circle *t*, insert pegs in the diameter lines *E R* and *G H* where the circle crosses them; on each side of these pegs measure 18 inches, insert a peg at each point as at *u n*. From the stake in centre *o*, with a string 6 feet long, trace circle *s* as shown; reduce the string 3 feet, and trace the inside circle *r*, and insert pegs 6 or 7 inches apart. Then lay lines between the pegs in the outside circle, as from *u* to *t* and from *u* to *v*, and insert pegs about 6 or 7 inches apart in circle *s*, bearing in mind to have a peg at each angle of the bed. Then lay a line round the pegs, also round the pegs in circle *r*. On each side of the stake in centre *o* measure 18 feet 4 inches on the diagonal lines *A C* and *B D*, insert a peg at each point, as in

v r v r, then lay lines as from the peg at point *u* to the peg at point *v*, and from peg *v* to peg *l*, and so on, until the four angular beds are lined; then cut out the beds, and the design fig. 31 is accurately transferred from paper to the ground to a scale of 12 feet to the inch.—M. O'DONNELL, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

CHRYSANTHEMUMS.

On the principle that too much cannot be said of a good thing, and the Chrysanthemum affording the chief supply of flowers, both for decoration and for cut blooms, when other flowers are scarce in November and December—even later than that with a few of the Japanese varieties—I now give a list of those which proved here to be good this year, leaving for a future paper a few varieties I saw good at Liverpool.

The proper time for putting in cuttings is November and December, though they may frequently be struck till March; still, I have proved that spring striking does not do for this part of England. Spring-struck cuttings find favour with many, on the ground that they are not so liable to be neglected as those struck in November, but there seems that then there is no time to make them flowering plants.

I say, Strike as early in November as possible, putting in the cuttings round the edges of 3-inch pots, potting them off singly into the same sized pots when rooted, and never allowing them to become pot-bound nor short of water from the time of the first potting till they flower. Water being very beneficial to the tops, either syringe or water overhead in the summer evenings.

I will take the large-flowering varieties alphabetically, beginning with *Amé*: *Fenêre*, which has generally proved good, but is rather loose and off-centred this time with me; *Autonelli* is very good and fine; *Ariadne* is second to none, being very free-blooming, of a pleasing colour, very effective, and late; *Aureum multiflorum*, a very bright good yellow, is very fine and good; *Bacley*, very early and good, pure white. *Bronze Jardin des Hêtales* is one of the best late tall varieties; *Cassandra*, a good early white, but the worst for mildew; *Florence Nightingale*, an excellent free-blooming though small-flowered variety; *General Bainbrigg*, a beautiful large flower and very effective; *Gloria Mundi*, an early, dwarf, free-flowering, good yellow; *Golden Beverley*, the best of the tall early yellow varieties; *Golden Dr. Beck*, a light yellow, very good and bright; *Golden Eagle*, first-rate, red and orange; *Guernsey Nugget*, very prolific and fine, rather late; *Jardin des Plantes*, a well-known tall late, rich yellow variety; *Lady Harding*, a very compact dwarf variety, very good and fine; *Lady Talland*, one of the most telling varieties of its colour; this is really good. *Lady Slade* is a very useful variety. *Little Harry* is, I may say, the finest early golden dwarf flower grown; *Lord Palmerston*, very fine and free, but late; *Mr. Cullingford*, a very fine dark purple variety; *Mr. Gladstone*, a very fine red chestnut, now beautiful; *Mrs. Hallburton*, an extra good flower, almost like a *Pollia*; *Orange Annie Salter*, a decided acquisition in its colour; *Prince Alfred*, a late, tall-growing, good variety; *Pelagia*, a fine flower of dwarf habit, and to be depended on; *Pink Perfection* I have seen good this season, but it is rather shy with me, which I attribute to its being struck late in the spring; *Rev. J. Dix*, a very good late orange red flower; *Robert James*, very striking, superior to *General Bainbrigg*; *White Eve*, the finest white grown. This should be in every collection.

In concluding the list of the large-flowering varieties, I wish it to be distinctly understood that I do not say that those I have named are the only good sorts, or that they are always good, but I believe they may be depended on.

Of the Japanese, which are very grotesque in their appearance, *James Salter* stands first; this is an extraordinarily free variety, and looks more like an artificial than a natural flower. It is an early variety, flowering in November. *Red Dragon* is a good variety; and *The Daimio*, a very effective sort, concludes my list of the Japanese Chrysanthemums.

Of the *Anemone* large-flowered kinds, I only number two—*Fleur de Marie*, a good, large white; and *Gluck*, a very fine golden orange.

Next come the *Pompon* *Anemone*-flowered. *Cedo Nulli* is the first, it being a very early useful variety; in fact, I may say the same of the other varieties of *Cedo Nulli*, *Golden Lilac*, which are very desirable for cutting. There are, doubtless, many desirable varieties of both the large and small-

flowered *Anemone* *Chrysanthemums* worth growing, but I content myself with the few named above.

Of the *Pompoms*, *Bijou de l'Horticulture* is very good and useful; *Bob*, well known, as it comes out better than ever; the same of *Drin Diun*. *Général Canrobert* is early and good; *Lizzie Holmes*, a very beautiful variety; *Lucinda*, very fine; *Rosa Travenna* is very early, and so is *White Travenna*.

The above list, I am aware, contains the names of many old varieties, but they are none the less desirable on that account. When speaking of the row sorts, I think the first year should not be finally decisive on their merits or demerits, as I have seen flowers condemned one year, and the following season they could not be too highly spoken of. My object in writing these notes is to place in the hands of the amateur or working gardener a short list of really good varieties suitable for conservatory and greenhouse decoration.

The culture of the *Chrysanthemum* being so generally known, it is not necessary to say more than that, to have good healthy plants, strike the cuttings in November or December in a cool house; one the same as that in which the plants are to grow. Pot the cuttings as soon as rooted, and repot them when the roots touch the sides; give them their final shift in August. Supply abundance of water both at the roots and top, but keep all manure water from them till they have set their flower buds. I do not plunge the pots, considering the plants healthier if not plunged, though requiring when unplunged more attention in the watering and repotting.—STEPHEN CASTLE, *Bent Hill Gardens, Frestwich, Manchester.*

THE POTATO AND ITS CULTURE.—No. 3.

FIELD CULTURE.

After the crop has been cleared off the ground allotted for Potato planting in the spring, it should be well cleaned previous to manuring, advantage being taken of a fine day or two, and the manure drawn on and spread over the surface; it should be next ploughed up as deeply as possible, and then left till planting time, when it will have to be cross-ploughed, that the rows may range north and south, so that the sun can most effectually fall upon them.

As soon as the preceding crop is off the ground, if this is poor and weedy, surface-dress it with a heavy scuffle, and heavy harrows to follow it, and let the weeds be picked off and burnt; and if one good scuffling do not clean the ground thoroughly, go over it again previous to manuring it. A fine, dry day or two should be chosen, and the dung drawn on and spread over the surface; and let the ground be ploughed up as deeply and as roughly as possible, reversing the furrows each time. The more roughly it is ploughed the better, for the frost can get into and through it better than if ploughed more evenly, and thereby kill vermin and pulverise the soil, and it will be far easier to turn over in the spring at planting time.

The reason I recommend manuring early in winter is that the manure should be better decomposed, and to further this object good mellow dung should be used.

The best way to plant the Potato in the field is to plough in the sets. Send the plough up the field, making a furrow about 1 inch deep. In this furrow the sets should be placed about 9 inches apart. A sufficient number of hands should be employed in planting, so that the plough may not be hindered. To obtain the proper distance from row to row the second furrow should not be planted, but it requires ploughing, or else the planted one will not be covered in. The rows will be a good distance asunder, so that the operations of earthing and digging or raising the crop will not interfere with the rows in the least. The Potato-earther in field culture is an instrument very much resembling a plough, the chief difference being that it is double-breasted, and the breasts are made of wood. I have seen wooden breasts made to fit to the plough. It will be seen that by the earther going one bout (as the ploughmen term it), or once up the field and down again, the plough cuts or leads up four rows.

The raising implement has a beam similar to a plough; in fact, the breast can be taken off the plough to admit the raiser, so that it saves the expense of a beam, &c. This raiser is sent up the centre of the rows, the horses walking in the furrow on each side of the row which is being raised; and it not only raises—that is, digs them up very much quicker, but very much better, for I have seen Potatoes come up amongst the succeeding crops, although they had been dug with the fork with the utmost care; but it is plainly seen that when the root is being

lifted with the fork the soil trickles back into the hole, and the fork has to be thrust in twice, and sometimes thrice, and then tubers are left behind; but the raiser goes to the bottom of the row and lifts every one to the surface. The ground must be flat-hoed once or twice, according as its weediness requires, previously to earthing. When the hantun is of sufficient height and strength the earther should be introduced, and when this task is accomplished nothing more is necessary to be done to the plants, except in cases where they have to be earthed-up a second time, but this is very rare.—J. C. LEWIS, *Gardener and Bailiff, Sulbury Rectory, Derby.*

MY AURICULAS IN 1870.

ALTHOUGH it was an unfavourable season for exhibiting in the neighbourhood of the metropolis, but few flowers being in bloom in the middle of April when the spring exhibitions of the Royal Horticultural and Botanic Societies were held, and on the 20th of May at the Crystal Palace nearly all were over, yet some of us about the beginning of May had an excellent bloom; and as all lovers of the flower are ever glad to get news concerning it, a few notes on my own blooms may not be unacceptable. It is one of the comforts—although, perhaps, also a disadvantage—connected with this flower, that we cannot give lists of the “new flowers of the last season,” not one-fifth of which will survive a couple of years. The flowers of days long ago are the favourites now, and we may only seem to be repeating an oft-told tale.

GREEN-EDGED VARIETIES.

Ashton's Prince of Wales.—Not by any means a large flower. The green of the edge pure; truss somewhat short.

Campbell's Admiral Napier.—A neat flower of good proportions.

Dickson's Duke of Wellington.—A flower much appreciated in the neighbourhood of London, but with too much colour in it to suit the particular taste of a connoisseur. In Ireland, where the taste is, I think, purer, it is not much thought of, neither is it in Lancashire.

Dickson's Earl of Errol.—A small grower. The edge very green, and the colour brilliant.

Leigh's Colonel Taylor.—I had one excellent bloom of this, perhaps the most noted of all Auriculas, from the high price it used to hold. The edge is a beautiful grass green, the paste is thin, and the plant is not a strong grower.

Hudson's Apollo.—A very refined flower. The ground colour is almost a chestnut, and the edge a light and pure green.

Littin's Imperator.—Flower-stems too tall. The plant is small, and the flower somewhat pointed; still it is good and useful.

Oliver's Lovely Anne.—Another very favourite flower in the neighbourhood of London, but it is very uncertain; sometimes, indeed more frequently, it is a grey edge—since were so this year.

Dickson's Matilda.—Another of Dickson's beautifully coloured flowers. It has a good constitution, but is rather short in the stalk at times. It makes a good exhibition plant, and very often can be shown as a grey edge.

Traill's General Neill.—A very pretty and neat flower, at times giving a capital truss, and a good exhibition plant.

Traill's Mayflower.—Another neat and good flower, and of fair constitution.

GREY EDGES.

Barlow's Morning Star.—A clean and good flower, and at times, as it did with me this year, forming a good truss.

Chapman's Maria.—I had a truss of this the present year, which in some points was unapproachable. The ground colour is one which is met with in no other Auricula, nor, as far as I remember, in any flower—a beautiful violet black; but the eye is too pale, the edge too dubious, and the petals too pointed, to rank it as a first-class flower, although for its colour it must be grown.

Chapman's Sophia.—A flower of the same style, but not so good; still, brilliant in colour and very pretty.

Clark's Mary.—A good flower, neat, and even in shape, and it ought to be in every collection.

Cheetham's Lancashire Hero.—A very beautifully shaped flower, apparently a seedling from General Bolivar. At one time it might have held the premier place in grey edges, but it is now surpassed, I think, by

Headly's George Lightbody.—A splendid flower, associated with the names of two of our very best florists. It is beauti-

fully shaped; a clear and distinct grey; ground colour dark; eye orange, and apparently a good-constitutional plant. Altogether perhaps the best Auricula in growth.

Fletcher's Mary Ann.—A good flower, with, however, the defect of having too small an eye. A small-habited plant, but not an unhealthy one.

Fletcher's No Plus Ultra.—A very large flower, probably the largest of any Auricula grown, but the constitution of the plant does not seem equally vigorous; still, it is not a bad grower, and it is always a desirable flower owing to its great size.

Lightbody's Richard Healdly.—A very pleasing flower, of good habit and refined in character. It generally blooms late—too late for the early shows held in April.

McLean's Unique.—A very fine flower when caught at its best, but the colour is apt to become soxy after it has been a little time in bloom.

Syde's Complete.—A very beautiful flower and very constant. It shows a very large truss, and hence it is necessary to thin the pipe in time, otherwise they are too small.

Waterhouse's Conqueror of Europe.—One of the most useful flowers we have. Very constant, pipe large, edge very decided grey, and habit of plant excellent.

WHITE EDGES.

This is the most defective of the four classes of Auriculas, there being few really good flowers in it, and, unfortunately, the very best of all is gradually becoming more and more difficult to obtain.

Heap's Smiling Beauty.—A very fine flower, but uncertain; in some seasons very fine, and in others indifferent. Its chief fault is that at times the white of the edge has a greyish colour;

Hepworth's True Briton.—A very fine flower. The pipe is perfect in shape, but it is difficult to get it flat. The plum ground colour contrasts well with the edge. The foliage is green and heavy.

Lightbody's Countess of Dumore.—A fairish flower, but not possessed of first-rate qualities.

Taylor's Glory.—The best of all white-edged flowers. What trusses I remember of it with my friend Dr. Plant! but now, alas! it seems to be dying out—so much so, that I find Mr. Lightbody has eliminated it from his list, and Mr. Meiklejohn has but small plants of it. It is a pure white edge, and has a well-shaped and smooth pip.

Traill's White Rival.—A good flower, but not equal to some of those already named.

Smith's No Plus Ultra.—Another very good flower, and of good constitution.

Popplewell's Conqueror.—Not strictly speaking a first-class flower, but always sure, throwing a good truss, and having very handsome deeply serrated foliage.

SELFS.

A very favourite class with outsiders, who will always pick out the rich-coloured flowers with which it abounds in preference to the edged varieties; although in the eyes of a fancier they do not hold so conspicuous a place, still they are very beautiful, and help greatly to relieve a stage.

Spalding's Blackbird.—Nearly black. Good round petal, and a good trusser.

Netherwood's Othello.—A first-class flower. Long stem, deep colour, and always good.

Campbell's Pizarro.—A deep, rich maroon, fine flower. The colour very rich, and the foliage quite white.

Smith's Formosa.—Small flower, of a most peculiar shade of light blue. Very effective for contrast with the deeper-coloured flowers.

Smith's Mrs. Smith.—A very constant deep-coloured flower, rarely disappointing, and of good habit. Indeed, the selfs are much more vigorous, as a rule, than the edged flowers.—D., Deal.

FLORAL CRITICISM.

[THE following is the paper to which was awarded Lieut.-Col. Scott's prize of £5 5s., for the best essay on the Principles of Floral Criticism, May 4th, 1870. Two other papers were sent in.]

THIS is a subject at once broad and comprehensive, affording scope for much more copious discussion than can be given in an essay as concise as this must of necessity be; for to enter into every detail of the subject—especially with regard to the standards of perfection set up for the different members of the floral world—would necessitate the writing of a good-sized volume. It is incumbent upon a writer of an essay of this description to be brief and to the point, and this I have studied to be; and in so doing I have endeavoured to discuss the matter from a natural and not artificial point of view, commencing

with the newly-introduced individual, and passing thence to the training thereof.

Newly-introduced plants should possess in some degree the following properties, which form the points upon which they should be judged:—1, Novelty in bloom or foliage; 2, Hardiness; 3, Vigour; 4, Blooming Capabilities.

1. *Novelty*.—Diversity in shape or colour of foliage is as essential to the production of effect as diversity in colour or form of bloom, or in habit or mode of growth. Novelty in either respect should, therefore, be considered as forming a very essential point.

2. *Hardiness*, or adaptability to the climate of this country with as little protection as possible, is undoubtedly of the greatest importance to horticulturists generally, in consequence of the great expense attached to the cultivation of plants which do not bear up against our changeable climate and low temperature. The chief aim of collectors and introducers of plants should be to intraduce such things as will involve the smallest possible amount of expense in their cultivation.

3. *Vigour*.—Hardiness and vigour of constitution are essential properties, for while we want hardiness we also require quick or vigorous growth and maturation, in consequence of the short and uncertain season wherein plants have to perform these operations.

4. *Blooming Capabilities*.—In addition to profusion we want duration and persistency, and more especially do we require persistency in conjunction with profusion. For if the plant be ever so profuse a bloomer, and the bloom drop as soon as it expands, it is comparatively worthless for decorative purposes.

Having considered the essential points from which a plant should be judged, I now pass to the consideration of the principles upon which the flower should be criticised. It is of the first importance that regard should be had to the chief characteristics of the order, class, or genus to which the individual may belong, and especially is this of importance with respect to double flowers; for to expect duplication to be as complete in a representative of the Geraniaceæ as in Rosaceæ or Composite, is unreasonable, in consequence of the difference existing between the number of stamens in the two first-named, and the composite nature of the latter. Neither can we expect it to be as complete or full in a flower whose aestivation is valvate, as in one in which the aestivation is imbricate. The forms assumed by flowers should also be considered in accordance with these general characteristics, whether they be regular or irregular.

The colour of the flower should in all cases be distinct from any previously known variety, except where it has other qualities of superior merit to commend it to notice, the resemblance of colour in many varieties of the same species being so considerable as to cause the greatest confusion. With colour, the stability of the same is essentially necessary, as is also good substance in the component parts; and more especially is this of importance in florists' flowers, for what presents a worse appearance with regard to flowers than a washy and flimsy flower? As in plants, so with their bloom; we want such flowers as will stand, without losing their colour, a good drenching rain or syringing—to one of which they will undoubtedly be in most cases made subject, especially the former, if the plants be hardy enough to be placed out of doors.

Odour is a property or qualification to be possessed in order to come near to perfection. Such odour to commend itself should be delicate and fragrant, for where the odour is strong, if placed in a confined atmosphere it becomes overpowering, and consequently obnoxious; strong-scented flowers are consequently comparatively worthless for use in the decoration of the sitting-room, where the air is undoubtedly confined.

To set up a standard by which flowers should be judged universally would be impossible, each species having a standard peculiar to itself. The point should be to ascertain what would make a plant or flower perfect, although there may be no chance of ever reaching such perfection; and then the comparative merits of all plants might be judged by the degree in which they approached the imaginary standard of perfection.

Having thus considered the principles to be observed in the criticism of newly introduced plants, I pass to the most important of all, with respect to a plant to be grown as a specimen of good cultivation—viz., its training.

The effect produced by plants, either individually or collectively, is regulated by the form they assume, or are made to assume. It is evident, therefore, that such forms only should be adopted as will produce good effects without in any way impairing the health, and consequently the beauty, of the individual. The modes of training of the present day are undoubtedly too conventional. Not only, in very many instances, is natural beauty sacrificed, but shapes and forms are adopted in which the greatest possible amount of distortion is necessary to obtain a given result, and detrimental alike to health and beauty, and very often diametrically opposed to natural disposition. Such modes of training should be discountenanced by censors, and only those admitted or encouraged that are most in harmony with natural disposition. Only just as much of the conventional should be admitted or allowed as may assist Nature in producing symmetry of form. The forms thus produced would not only be in harmony with Nature, but would produce an effect altogether ornamental, which would be much in advance of the tight-lacing system, of which we see so much.

There is no doubt that the loss of foliage from which so many

trained specimens suffer before their blooming season arrives, is attributable, in a great measure, to tight lacing, as is so often the case with Azaleas. The pyramid, or some modification of that form, is no doubt the form best suited to those plants, as well as to the majority of flowering plants, being more in accordance with natural disposition; but to tie in every twig so as to prevent the appearance of its having been cast in a mould, or glued to a shape made for the purpose, is not only unnatural, but injurious. Plants thus grown or exhibited are far from the standard of perfection set up by Nature. A plant denuded of the greater portion of its foliage, if ever so well bloomed, cannot justly be adjudged an example of perfection; and a plant tied so as to hide the foliage in endeavouring to expose the greatest possible amount of bloom to the eye at a glance, is an example of bad taste, and a direct violation of the principles daily exemplified in nature. To give prominence to bloom is unquestionably correct, but not to the exclusion of foliage. Foliage is as essential as bloom to the production of effect. There are exceptions, where plants naturally produce bloom in advance of foliage. In such cases bad training or cultivation is not the cause, but natural disposition. Plants, to show their beauty either individually or collectively, should not be made to assume anything like stiffness or formality. To produce in plants for exhibition the greatest possible amount of bloom and foliage in the smallest possible space as regards pot room, should be held as most essential, thereby shutting out from our exhibitions large and cumbersome pots.

The whole matter seems to resolve itself into the principle of setting up an ideal standard of perfection, consonant with the habits and general characteristics of different species, and deciding the merits of the plants by the degree in which they approach it.—A. BRADLEY, S. Salisbury Road, Highbury Hill, late of Stowlangtyn Hall, Bury St. Edmund's.

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 7.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Mr. Thomas Simpson, of Froonfield, Chelmsford, sent a Cauliflower, called "New Autumn Cauliflower," which, in the opinion of the Committee, was the same as Walsheeren. Mr. T. Bray, gardener to E. A. Sanford, Esq., Nynohed, Wellington, sent a bundle of forced Asparagus of great merit, which received a special certificate. Mr. Calder, Luton Hoe, Beds, sent a seedling Cucumber, raised from seen Berkshire Challenge and Lord Kenyon's Favourite, but it was not regarded as a desirable acquisition. Messrs. Rutley & Silverlock sent specimens of Banbury Improved White Spanish Onion, grown by Mr. P. J. Perry, Banbury, which received a special certificate as superior specimens of the true White Spanish Onion. Mr. M. Hibblethwaite, gardener Aukland Hall, sent fine specimens of the true Lapstone Kidney Potato.

Rev. T. C. Brabant, of Guernsey, sent cobs of thirty-four distinct varieties of Indian Corn, grown in Guernsey. Some of these were of the ordinary yellow colour, others red, white, brown, and mottled, and all were as perfectly ripened as imported Indian Corn.

Mr. R. T. Pince, of Exeter, sent a bunch of a seedling Grape, raised from a seed taken from the same berry as that from which Mrs. Pince's Black Muscat was obtained. The bunch was of large size and tapering, exactly similar in shape to that of the Black Muscat. The Committee did not think the quality sufficiently good to merit a first-class certificate.

Mr. William Paul, of Waltham Cross, sent three seedling Grapes. One, called Waltham Cross, was very large, the berry being one of the largest of the whites in cultivation. The bunch is large and long, the berries long-oval, and of an amber colour, fully 1½ inch long, and 1 inch wide, like a good-sized Plum, and the flesh firm and solid, with an excellent flavour. It received a first-class certificate, and was considered a valuable late-hanging and good show variety. Mr. T. Clements, gardener to G. G. Hall, Esq., Blackwell Hall, Chesham, sent three good bunches of Black Alicante Grapes, which were rather deficient in colour. Mr. Wells, of Southend, sent five fine and remarkably well-coloured bunches of Black Alicante, grown in his ground vineries. They were well grown, but deficient in flavour. Mr. Sage, of Asbridge, sent a bunch each of Black Alicante, Lady Downe's, and Mrs. Pince, all of which were very well grown, and excellent in flavour. They were awarded a special certificate. Mr. Ellis, gardener to R. Lewis, Esq., Greenford Hall, Southall, sent Barbarossa, very deficient in colour.

Mr. McLean, gardener to W. P. Herrick, Esq., Beau Manor Park, Loughborough, sent a fine and handsome specimen of Smooth-leaved Cayenne Pine Apple, which received a first-class certificate. Messrs. Standish, of Ascot, sent a seedling Apple, called Painted Lady, a beautifully coloured variety, being rich bright crimson streaked with yellow. It is highly ornamental, and, the flavour being acid, it was commended for its beauty.

Mr. Gilbert, of Bangleby Gardens, sent a seedling Apple, called Mea's Seedling, which was past its best. Mr. Turner, of Slough, sent a basket of Cornish Aromatic Apple, fine in colour, and excellent in flavour. It was awarded a special certificate. Mr. Cox, of Redleaf,

* Mr. Bradley obtained a first class certificate in Floriculture, and a second class certificate in Fruit and Vegetable Culture, at the Royal Horticultural Society's examination in December, 1870.

sent a dish of highly-coloured Blenheim Pippins, which were much admired.

Mr. Chaff, gardener to Alfred Smee, Esq., F.R.S., sent a collection of twelve varieties of Kitchen Apples and twelve of dessert, to each of which a special certificate was awarded. Mr. Hibbelthwaite, of Acklum Hall Gardens, sent a collection of Apples and Pears, to which a special certificate was awarded. Mr. J. Hepper, gardener to C. P. Millard, Esq., The Elms, Acton, sent a quantity of fine specimens of Chamoisette Pears, which received a special certificate. Mr. Turner, of Slough, sent a seedling Pear, called International. G. F. Wilson, Esq., sent a basket of Josephine de Malines Pears of extraordinary size and beauty, to which a special certificate was awarded. Mr. Gilbert, of Burghley Gardens, sent a stand on which to exhibit fine Apples, which was approved by the Committee.

Messrs. Carter & Co., of Holborn, exhibited specimens of the New Red-skinned Flour Ball, and the Red American Potatoes, for the purpose of deciding whether they are synonymous; but the Committee declined to decide till they were seen growing. Mr. William Thomson, Blantyre, sent two seedling Potatoes, Hero and Favourite. Both were boiled, and Hero was found to be very mealy and of good flavour.

Messrs. Carter & Co. sent very large specimens of White Belgian, Altrisham, and Long Red Carrot, which received a special certificate.

Prizes were offered on this occasion for the best collection of Salads, and were taken by Mr. Hepper, gardener to C. P. Millard, Esq., The Elms, Acton, and Mr. Gilbert, gardener to the Marquis of Exeter, Burghley Park. Mr. Hepper had Mustard, Curled Cress, Australian Cress, Corn Salad, Red Turnip Radish, Water Cress, two kinds of Cucumbers, Cos and Cabbage Lettices, White and Green Curled and Batavian Endive, Red and White Celery, Beet, and Onions. Mr. Gilbert, who was second, had Mustard and Cress, Cucumbers, Celery, Lettuce, Batavian and Curled Endive, Beet, &c. Both collections were neatly set up—that of Mr. Gilbert in a box made for the purpose of exhibiting Salads.

Mr. Lee, of Windlesham, sent a fine super of honey, weighing 35 lbs., and one of his new octagon straw hives.

This was the last meeting of the year, and the Committee was therefore dissolved, in accordance with the resolution of last year, and a vote of thanks to the Chairman was passed unanimously.

FLORAL COMMITTEE.—W. Beattie Booth, Esq., in the chair. From Mr. Williams, Holloway, came a collection of Orchids, in which were good specimens of *Lelia anceps* with six spikes, *Calanthe Veitchii*, *Odontoglossum cariniferum* and *Rosii*, *Cattleya Skaueri*, and *Maxillaria nigrescens*. Mr. Williams likewise sent a collection of his fine ornamental-fruited Solanums. A special certificate was given for the two collections.

Mr. Robins, gardener to Sir E. Kerrison, Bart., Oakley Park, Basingstake, exhibited a plant of *Capsicum Yellow Gem* trained as a dwarf standard, with a rather flat head, and bearing numerous yellow pods, giving the plant a very ornamental appearance for decorative purposes. For this a special certificate was awarded.

Messrs. Veitch sent *Amaryllis Spotted Gem*, a hybrid between *paradinum* and another sort, with the white ground beautifully dotted with red.

From Dr. Ainsworth, Lower Broughton, Manchester, came a very fine spike of what was called *Oncidium Barkeri*, and which was the *O. tigrinum* of La Llave. For this a special certificate was given; and a similar award was made to Messrs. J. Brooke & Co., Fairfield Nursery, Manchester, for *Dendrobium bigibbum* with a spike of eleven flowers, six of which were in great beauty, the rest not being as yet expanded, and for a very large-flowered *Odontoglossum Rosii* with two fine blooms.

Mr. Trusler, Farnham, Surrey, sent seedling Carnation Sensation with variegated leaves, and Mr. Drover, Farnham, a seedling Zonal Pelargonium, and *Selaginella leptophylla*, the Resurrection Plant.

Mr. Green, gardener to W. Wilson Saunders, Esq., Hillfield, Reigate, had a first-class certificate for a *Mormodes* with three spikes resembling those of a Hyacinth; the flowers red with deeper-coloured spots, the column white, but in a younger state they are of a rich orange. There is some doubt as to the species—it bears considerable resemblance to *Mormodes Cartoni*, figured in the "Botanical Magazine," t. 1211, but differs from it in colour.

Mr. W. Lee, Arundel, Sussex, had a first-class certificate for seedling Carnation White Nan, and a second-class certificate for Maiden's Blush, both free-blooming varieties. Mr. G. Goddard, gardener to H. Little, Esq., Cambridge Park, Twickenham, sent a collection of Fern-leaved Primulas; and from Mr. Wiggins, gardener to W. Beck, Esq., Isleworth, came a fine collection of the same, including fine white and crimson varieties, for which a special certificate was given. Mr. Wiggins also sent some varieties in which the flowers were streaked and dotted, and in one instance half white, half purple. Mr. Brown, florist, Hendon, had a special certificate for collections of seedling *Cinerarias* and Chinese *Primulas*, both very bright in colour.

Messrs. Perkins & Sons, Coventry, had a first-class certificate for a seedling *Selaginella* called *albo-lineata*, tipped and lined with yellow, a very ornamental variety.

From Messrs. E. G. Henderson, St. John's Wood, came a collection of 30 Sedums, 113 species and varieties of Saxifrages, 70 Sempervivums, and several *Echeverias*, Aloes, and similar plants. A special certificate was awarded, and a like award was made to the same firm for a very attractive group of winter-flowering tree Carnations.

Mr. Stevens, Ealing, exhibited a basket of Ealing Rival Tricolor Pelargonium, which has been frequently noticed, with finely-coloured leaves. Mr. Goddard, gardener to H. Little, Esq., Cambridge Park, Twickenham, had a first-class certificate for *Cyclamen persicum purpureum*, a beautiful purple-coloured variety. A special certificate was given to Mr. Clarke, Twickenham, for a fine collection of *Cyclamens* raised from seed sown on January 22nd of the present year.

Prizes were offered for twenty-four cut blooms of Japanese and late *Chrysanthemums*. The first prize was taken by Mr. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, Ilford, with a stand in which were fine examples of *Miss Marechaux*, *Princess of Teck*, *Yolande*, *Plutus*, *Blonde Beauty*, *Virgin Queen*, *Lady Talford*; and of Japanese varieties, *Comet*, *Dr. Masters*, and *The Mikado*. There were also very good blooms of several others of the large-flowering varieties. Mr. Goddard had the second prize for a stand of twenty-four—viz., twelve Japanese kinds, of which *The Sultan*, *The Daimio*, *Madame Godillot*, *Dr. Masters*, and *Aurantium* were the most conspicuous, and twelve large-flowering kinds.

Class 2, was for the best collection of hardy evergreens bearing berries; in this class there was no entry, but Messrs. Standish & Co., of Ascot, sent a beautiful collection of green-leaved and variegated Hollies, consisting of *Hex balcarica hybrida*, and *I. Handsworthii pendula*, the yellow-berried Holly, a number of *Aucubas* in berry, *Skimmia oblata*, and the black-purple-berried *Raphiolepis ovata*. This collection, containing so many plants bearing a profusion of scarlet berries, had a fine effect. A special certificate was awarded.

Class 3 was for the best collection of herbaceous plants suitable for out-door winter decoration. The first prize went to Messrs. E. G. Henderson, who were the only exhibitors, for a collection in which were *Statice Armeria*, *Centaurea rousina*, *Festuca glauca*, *Achyrocline Saundersii*, *Statice pseudo-Arueria*, var. *dianthoides*, *Thymus strictus*, *Cimeraria acanthifolia*, *Veronica Andersoni variegata*, *Centaurea asplenifolia*, variegated *Thymes*, *Stachys lanata*, *Arenaria balcarica*, *Ajuga genevensis rubra*, *Ambly alpina variegata*, *Veronica candida*, *Aceua microphylla*, *Lilium candidum aureo-variegatum*, *Hebebra rubra*, and some others.

A prize of £5 was offered by J. Bateman, Esq., for the best collection of cut blooms of *Cattleyas*, the flowers to become the property of the Society, but no exhibitor came forward.

GENERAL MEETING.—W. Marshall, Esq., in the chair. After the preliminary business and the election of eleven new Fellows, the Rev. M. J. Berkeley remarked with regard to the *Mormodes* exhibited by Mr. Green, gardener to W. Wilson Saunders, Esq., that he believed Mr. Green very properly considered it to be a variety of *Mormodes Cartoni*. At one time he (Mr. Berkeley) had a notion that it belonged to *M. igneum*, figured in the third volume of "Paxton's Flower Garden;" but in the same plate as *igneum* were two sorts, marked B and C, which Dr. Lindley considered to be mere varieties of *M. Cartoni*, and Mr. Berkeley had no doubt that Mr. Green's *Mormodes* was identical with that distinguished as B. A Grape, of which the bunches were parti-coloured, next came under notice, and it was remarked that the same peculiarity extended to the leaves.

Mr. Meacham's remarks on fasciation were then referred to, and Mr. Berkeley said there had been some confusion between fasciation and polyclady, in which, from the attacks of Fungi and other causes, an extraordinary number of branches are produced. Mr. Berkeley, after reading a paper from the Rev. T. C. Brabant on the varieties of Maize exhibited, remarked that the experience at Chiswick had not been favourable to the cultivation of Maize as a vegetable.

The Chairman announced that as there had been no exhibition for Mr. Bateman's *Cattleya* prize, that gentleman had decided to again offer the same amount, but divided into a prize of £3, and one of £2, at the next meeting, January 15th. It was also stated that the Rev. G. Kemp had again offered his prize for out-door Grapes for next year, but to be competed for in November instead of October, as it was this year.

NOTES AND GLEANINGS.

It is gratifying to know that there is now an establishment for the EXPORT OF JAPANESE PLANTS, SEEDS, AND BULBS. The head of the establishment is Mr. C. Kramer, Yokohama, Japan.

As an instance of the RAPIDITY WITH WHICH INTRODUCED PLANTS SPREAD, when soil and climate are congenial to their habits, we may point to the *Euphorbia prostrata*, *Lit.*, a little annual weed in Jamaica and Trinidad, which became introduced by chance about ten years since into a garden in Madeira, situated some 400 feet above the sea; from this spot it has rapidly spread down the steep road to the town; while up the other hills, separated by deep ravines from that down which it came, it has scarcely crawled at all, a downward course apparently being far easier for it than an upward one. It has, however, slowly crept up another hill at the rate of about 10 feet a-year. The seeds, which are described as eamunculate, with sharply tetragonal paleæ, transversely keeled, are well adapted for sticking to the clothes of travellers, and to be

carried about, so that we might well expect the plant to crop up in all directions. Mr. Lowe says that it is now to be found everywhere in Funchal below 500 feet.—(Nature.)

CHATSWORTH.—No. 2.

The kitchen garden is across the park, and at a considerable distance from Chatsworth House; it is very extensive. In addition to the fine crops of vegetables on all sides, the ranges of glass houses and their contents are a most interesting and instructive sight. Many of them rest against the cross walls which intersect the garden at regular distances; but there are other ranges and separate houses near the entrance to the gardens first claiming notice. The first in order of these is the Amherstia house, containing the large plant of *Amherstia nobilis*. The plant, I was told, had produced this season nearly a hundred of its gorgeous racemes; it certainly ought to present an appearance of uncommon magnificence when in flower to compensate for its very dull aspect at other times. A variety of Pitcher Plants growing in this house were very fine, especially *Nepenthes Hookeriana* and *Rafflesiana*. Here was also a striking group of the large-leaved *Theophrasta imperialis*.

In pleasing contrast to the dullness of this house, the Victoria house strikes one as a peculiarly light and attractive structure; its contents were all objects of interest, and every plant was in fine health. Of course, the regal Lily in the central tank is the first object for which one looks; the foliage was good, but there were no very extraordinary flowers visible at the time of my visit, September 1st. Some fine specimen *Achimenes*, intermixed with Ferns and dwarf Palms, formed a graceful and attractive margin to the Lily tank. The rippling cadence of the water falling on the little revolving wheels, which are ingeniously made to constantly agitate the water in the tanks, has a novel and pleasing effect. Growing in the corner tanks and around the sides were fine plants of the huge-leaved *Caladium esculentum*, *Nymphaea dentata*; *Nymphaea stellata*, with blue and yellow flowers; *Nymphaea Devoniana*, with deep pink flowers; the singular pendent Rush-like *Bonapartea juncea*; the beautiful *Pandanus utilis*; *Clerodendron coccineum*, a perfect mass of bright scarlet flowers; and *Nelumbium speciosum*, with deep green peltate foliage borne on long slender stalks. The building is 68 feet long by 48 feet wide; it has a ridge-and-farrow roof, supported by light iron pillars, which are painted blue and white.

The New Holland house is about 100 feet long by 30 wide. Some *Fuchsias* trained to the roof, and laden with flowers, had a pretty effect. The body of this house was filled with magnificent specimen hardwooded plants; some Heath, pictures of health, must have been quite 5 feet in diameter; the *Azaleas* and *Camellias* were also very fine.

A drive leads past this house to Lady Paxton's villa; it was covered with the white spar for which Derbyshire is so famous. From its chaste appearance this material is admirably adapted for walks in many parts of ornamental grounds; in the flower garden some caution must be exercised in its use, but among the greenery of shrubs it is very effective. A winding flower border on one side of the drive struck me as contrasting very favourably with the formality of the ordinary straight ribbon border. All the borders were planted with much taste; one of eight rows was particularly fine; the front row was *Cerastium tomentosum*, the second *Lobelia speciosa*, the third *Golden Purothrum*, the fourth *Iresine Herbstii*, the fifth a variegated *Veronica*, the sixth a brown *Calceolaria*, the seventh *Stella Pelargonium*, and the eighth *Cineraria maritima*.

A span-roofed stove contained a fine collection of plants, such as *Clerodendrons*, *Dracenas*, *Caladiums*, a fine *Allamanda nobilis*, the pretty *Meyenia creta*, *Bougainvillea glabra* laden with its pretty pink bracts, and the beautiful *Echites rabecvosa* climbing under the roof. Next this were two very light houses of a similar form, used principally for forcing Vines in pots. Some Cucumber plants were being started in one house for a winter supply, and in the other were Kidney Beans in pots, the young plants being just visible above the soil. These useful houses are also employed for forcing Strawberries and a variety of other purposes.

Of the other miscellaneous houses, an old stove contained some fine plants of *Pandanus elegantissimus* and *Javanicus variegatus*, and in a greenhouse were some immense pyramidal *Azaleas* 8 feet high, and a very fine stock of healthy young plants of large-flowered *Pelargoniums* trained to the usual flat surface, also a fine batch of *Primulas*.

Turning now to the vineries, the Vines in the early house

were already pruned and in readiness for work. In the next house were the Vines from which were cut the Grapes that were exhibited at Oxford. The young wood of these Vines was not particularly large, but it was thoroughly firm and well-ripened, with plenty of fine plump buds; the foliage was large and very healthy. There were plenty of bunches still hanging to show how fine the crop must have been. The varieties were Black Hamburg, Black Prince, and Mill Hill Hamburg; the last-named kind had magnificent well-shouldered bunches of very large deep black berries, which had that hammered appearance usually developed in well-grown Grapes of this class.

In the first of the lean-to ranges, which I was told were about 200 feet long, the first and second houses were both wholly occupied with Black Hamburg Vines, all carrying a splendid crop of high-coloured fruit. The third division was a mixed house of Black Prince, Charlesworth Tokay [*Muscat of Alexandria*], small in bunch but fine in berry, and Frankenthal with magnificent bunches splendidly coloured. In the fourth house were more fine bunches of Frankenthal, Royal Vineyard with tolerably large bunches and with very vigorous wood, some very fine Black Tripoli, and some excellent examples of the delicious Black Frontignan. Frankenthal appears to be a favourite here, for in the fifth house it was in full force with immense bunches splendidly finished. Black Alicante also had a grand crop of fruit, and Lady Downe's was equally fine; its wood of the current year was very stout and vigorous. The sight of these fine houses of Grapes was a treat, the condition of the Vines, and the very fine crops which they bore intact when I saw them, were most satisfactory. The sixth and seventh divisions were early and succession Peach houses, with a healthy lot of trees; and the last house was a mixed vinery, the sorts being principally Muscats.

In the next range, which is a new one, the first and second divisions contained flourishing young Peach trees planted in the borders, and a number of Fig trees in pots. The third division is an orchard house; the trees, which are Peaches and Nectarines, were planted in the border at regular distances, thus forming a plantation all through the body of the house. The form of the trees was that of a tall bush; all of them were very healthy, and bearing full crops of very fine fruit. The other division of this range is a Plum house, with trees of a similar form, and disposed in the same way as the Peaches; the crop of fruit was so abundant that many of the branches were bending beneath their luscious load. Some Apricots trained to the back wall had also been cropping well.

The third range presented as interesting a sight in fruit-culture as any in the garden, in the two enormous old Peach trees which occupy a large compartment of upwards of 100 feet in length. The trees are trained to the roof, one of them has a spread of fully 50 feet, and the other is larger still; I did not measure them, but I am confident I am within bounds. Both were in robust health, and well furnished with young wood from the bottom upwards; they also had an even crop of fruit, not so large, perhaps, as that on some of the younger trees, but quite large enough to be useful for furnishing hundreds of dishes for table.

In another range in the first division there were splendid young Vines with some fine fruit; the sorts were *Muscat of Alexandria*, *Gros Colman* with fruit of an extraordinary size, and *Black Alicante* fine. The second house also contained young Vines equally vigorous. With the exception of an even crop of *Muscat of Alexandria*, the Vines in the other divisions call for no special mention.

Several ranges of fruiting and succession Pine pits contained a magnificent lot of Pines; in one, especially, there was a batch of *Cayenne* all with very fine fruit. The whole of the plants appeared to be as clean and vigorous as could be wished. All the pits had simple sliding sashes about 9 or 10 feet long, and they are overlooked from raised platforms at the back of each range, so that it will be understood there is no door nor passage to any of them. In fact, their appearance is just that of ordinary brick pits, very different from the costly glass structures for this purpose so frequently to be met with, yet I very much question if the grandest modern Pine house ever contained a better average crop of fruit than was to be seen in these very humble-looking but most efficient pits.

Taken as a whole the fruit-culture under glass at Chatsworth merits the highest praise, for not only were the crops of all kinds of fruit most abundant, but from the way in which all points of excellence were developed it was evident that skill of a very high order had been brought to bear upon their management. This remark applies with equal force to every depart-

ment of the gardens; wherever one turned, order and an appearance of exquisite finish and neatness prevailed. Very rarely indeed is it that one sees a garden in which there is so little to which exception could be taken; no object appeared to be cared for at the expense of others, but all were alike most satisfactory.

To anyone travelling from Derby as I did, a visit to Chatsworth implies a most interesting and enjoyable trip, for the railway from Derby to Rowsley winds through some of the most beautiful scenery of Derbyshire, the bold character of which is very striking. Hills in endless variety present themselves to the eye; some destitute of vegetation, excepting the closely cropped turf, stand out boldly and clearly, rearing their lofty crests in most picturesque contrast to others clothed from base to summit with a compact mass of trees. Now a magnificent vista opens out along some pleasant dale, affording glimpses of other hills, with their bold outlines softened into grace by the distance; and then, as at Matlock Bath, the hills rise in lofty majesty, towering high overhead, clothed in some parts with dense foliage, among which glimpses are caught of picturesque cottages snugly perched on the steep hillside, and of places where the face of the cliff exposes the craggy strata as they dip downwards to the valley. Passing through such scenery as this the mind is prepared to thoroughly enjoy and appreciate the refinement and magnificence of Chatsworth, which impresses one as being altogether worthy of its exalted position in a county so rich in the beauties of Nature.—*EDWARD LUCHNERST, Old Lands, Buxted, Sussex.*

HEATING BUILDINGS BY HOT WATER.

THE proverbially fickle climate of the British Islands (says the *Mechanic's Magazine*), and the frequent recurrence of a damp and cold atmosphere, make the application of artificial heat to our dwellings and public buildings a positive necessity. Contrivances for producing an equable temperature within doors are consequently numerous, and in many instances they are of an ingenious character. Perhaps the best mode of accomplishing the desired end, as well as the simplest, is that of causing the circulation of hot water through iron pipes conveniently disposed for the purpose. Up to a very recent period, however, a considerable amount of hostile prejudice existed in regard to the use of hot-water apparatus, and even now the plan of heating buildings by such agencies is not fully appreciated. Imagining that antipathy to the system arises in many cases from a lack of acquaintance with its peculiar merits, we shall endeavour to explain the principles which govern the action of hot-water apparatus generally, and furnish some information as to their best form and proportions. In order to do this effectually, we must first glance at one or two of the natural laws which affect the circulation of fluids and gases. That all falling bodies gravitate with the same velocity and therefore descend through a certain definite space in a given time, is an effect of which gravity is the cause. It is from this cause that we obtain the unerring action of the pendulum. To the same source may be distinctly traced the phenomena attending the circulation of hot water through pipes, and this circulation, once created, forces all the water in the apparatus to pass successfully through the boiler by which it is primarily heated. It is upon the continuous and uniform movement of the water along the pipes that the efficacy of the hot-water apparatus immediately depends. Let us, then, inquire as to the power which insures this vitality, for without a clear perception of its nature there will ever be uncertainty as to the working of any apparatus of the kind in question. The force which produces circulation arises from the fact that the water in the descending pipe is heavier than that which is in the boiler, or, to put it differently, when heat is applied to the boiler a dilatation of the water within it ensues. The heated particles ascend through the colder ones, whilst the latter descend by reason of their greater specific gravity, and in turn become also heated. Expansion follows, and this species of action and reaction proceeds until all the particles are equally heated. It follows that the colder the water is in the descending pipe, relatively with that in the boiler, the more rapid will be its motion through the circulating pipes, and hence the diffusion of heat through their pores and into the atmosphere surrounding them.

Thus much of the general principles which control the action of hot-water apparatus as applied to the heating of buildings, and now as to their particular dimensions and details. These will naturally have to be varied with the character and size of the buildings to be heated. For churches and large structures

of a similar kind, and which have an ordinary number of doors and windows, it will be necessary in devising hot-water apparatus to ascertain, first, the cubic contents of the auditorium. Having obtained this knowledge, let the number gained be divided by 200. The quotient will yield the length in feet of 4-inch pipe required to maintain something like a steady temperature of 55°. For smaller apartments, as, for example, dwelling houses, &c., the cubic measurement divided by 150 will furnish the proper length of 4-inch pipe. These simple rules, which are the result of extensive practice and careful observation, may be safely relied upon, unless under very exceptional circumstances, and which, of course, would have to be duly considered by the constructor of an apparatus intended to meet them.

In reference to greenhouses, conservatories, and buildings of a like character, where the temperature should reach a mean of 60°, the sum of the cubic contents divided by 30 will give the length in feet of 4-inch pipe required to produce the desired effect. Forcing houses, again, must have special calculations made for properly heating them. Nothing short of a uniform temperature of 70° to 75° will suffice for such places. In order to insure this the measurement, as before suggested, must be divided by 20, the quotient being the length of circulating pipe required. For gaining yet higher temperatures, lower divisors will have to be employed, and if smaller pipes be determined upon, the length must be proportionately increased. These are points of detail, however, which may be safely left to the skilled manufacturer who may be intrusted with the making of hot-water apparatus for special purposes. Our own data may be taken as the base of calculations for economically and effectually heating buildings by means of hot water.

We are aware that some horticulturists have adopted the plan of heating their forcing-houses to a much higher temperature than that indicated above, and of allowing a greater amount of ventilation than is usual. By aid of such arrangements, it is said, a fiercer fire is obtained, but there is no doubt that this course involves increased expense in the first cost of the heating apparatus, together with a large augmentation in the subsequent daily consumption of fuel for working it.

An important consideration to the horticulturist and floriculturist is the waste of heat through glass roofs and walls. It has been found, from a course of carefully-made experiments, that 1 square foot of glass will cool 1,279 cubic feet of air as many degrees per minute as the internal temperature of the house exceeds the external temperature. Thus, if the difference between the internal and the external temperature be 30°, 1,279 cubic feet of air will be cooled 30° by each square foot of glass in the building which is exposed also to the outer atmosphere. It will be admitted that this fact should be allowed its due weight in contriving hot-water apparatus for houses wholly or partly constructed of glass. Of course, in estimating the area of glass, due deductions must be made for the sash frames and woodwork by which the panes are surrounded. If the frames and sashes be made of metal, the radiation and consequent loss of heat through them will be equal in extent to that which results from the glass itself.

The quantity of air to be heated per minute, so far as conservatories and forcing houses are concerned, should not be less than 1½ cubic feet for each square foot of glass which the building contains. When the quantity of heated air required has been thus ascertained, the length of pipe may be determined by the following formula:—viz., Multiply 125 by the difference between the temperature at which the house is proposed to be kept (when at its maximum) and the temperature of the external air, and divide the product by the difference between the temperature of the pipes (200°) and the proposed temperature of the room. Then the quotient multiplied by the number of cubic feet of air to be heated per minute, and its product divided by 222, will give the number of feet of 4-inch pipe to yield the desired effect.

CLIMBING FERNS.—No. 4. STENOCHLENA.

A FAMILY of Ferns comprising but few species, and nearly allied to Lomaria. They have long, smooth, creeping rhizomes, which fasten themselves to the stems of trees or other objects, and by which, in a state of nature, they climb to considerable heights. They produce fronds of two forms having free-forke veins, which spring from an obscure vein running parallel with the midrib, and on which in the fertile fronds the sori are situated, but, through their being so much contracted, these appear

to cover the whole under side. When placed in genial situations these plants are a great acquisition to a Fern house.

S. SCANDENS.—A noble plant, with large pinnate fronds from 2 to 3 feet in length. The pinnae are 6 or 8 inches in length, somewhat pendent, broad, oblong-acuminate, and dark shining green, the edges furnished with spiny teeth. The fertile fronds

Stenochlaena scandens.—Pinna of barren frond and part of a pinna of fertile frond, medium size.

are also pinnate with linear pinnae. The latter, however, are rarely produced. It requires stove heat, and is a native of the East Indies.

S. MEYERIANA, sometimes called *S. tenuifolia*, is another very handsome scandent species, producing pinnate barren fronds; the pinnae being somewhat distant, thin in texture, serrate at the edges, and bright light green. The fertile fronds are contracted and bipinnate. It thrives in a lower temperature than the preceding, and is a native of South Africa.

S. HETEROMORPHA.—A plant of somewhat recent introduction, and too much neglected by Fern-growers. It is a very neat-growing species, producing from its thin wiry rhizomes pinnate fronds some 6 or 8 inches in length, the rhizome and rachis being clothed with reddish brown chafly scales. The pinnae are sub-rotund, becoming oblong in old plants, petiolate, and have the margins deeply dentate. The fact of its being a small-growing plant and succeeding well in a cool house, should recommend it to the favourable notice of all Fern-cultivators. Its fertile fronds I have never seen. Native of New Zealand.

NEPHROLEPIS.

This genus contains some very handsome species which should recommend themselves to the notice of lovers of Ferns, from the rapidity with which their long wiry rhizomes climb over and about the walls or any rough surface in the fernery, and soon give the house a furnished and established appearance by draping them with beautiful, pendent, dark green fronds. The genus *Nephrolepis* is distinguished by its long, creeping, wiry rhizomes and pinnate fronds, the pinnae of which are articulated and sessile; they have free-forked veins and round sori, which are furnished with a reniform or orbicular indusium.

The species of *Nephrolepis* are stove Ferns of remarkably rapid growth; they produce long stolons which form young plants at short intervals, and these again produce others, so that in ferneries of limited extent, in which the plants are not grown in pots, some care will be necessary to prevent their overrunning and destroying other and more slow-growing kinds. I am not an advocate for withholding water from Ferns, and neither will this genus suffer such treatment with impunity, for on account of the pinnae being articulated with the rachis they readily fall out of their joints if neglected, and the consequence is the cultivator is rewarded by bare stems instead of bright green cheerful fronds. When grown as pot plants a mixture of loam, peat, and sand suits them well; but when planted out in the rockwork of a natural fernery they are by no means particular, but attach themselves in any moist crevices, and send down roots until they reach a genial soil.

N. HIRSUTULA.—This is an exceedingly interesting and elegant species, yet somewhat rare. The fronds measure from 18 to 36 inches in length, lanceolate in shape, pinnate, and sparingly clothed with reddish brown hairy scales; the pinnae are about 3 inches in length and full green. It is a native of the East Indies.

N. PECTINATA.—An elegant slender-growing kind, which quickly drapes a wall or pillar with its light green pendent fronds. These are from 18 to 30 inches in length and pinnate, with the pinnae much crowded, oblong, and dentate at the edges. Although this plant is somewhat common, on account of its being so readily increased, it is, nevertheless, very handsome either planted in the open fernery or grown in a pot. It is a native of various parts of tropical America.

N. DAVALLIODES.—This is the largest and strongest-growing species in the whole genus; the fronds are from 1 to 4 feet in length, pinnate, with beautifully curved pinnae from 3 to 6 inches in length. The barren pinnae are slightly dentate at the edges, much broader than the fertile ones, and dark green; the fertile pinnae are narrow, deeply lobed at the edges. Upon the apex of each lobe the sori are situated, producing an effect somewhat similar to that of *Lygodium*. In a young state the plant produces only sterile fronds, but as it attains maturity the upper portions become fertile, and ultimately a few barren pinnae are only developed at the base. It is a very fine plant, and a native of the Malayan Archipelago.

N. UNDULATA is a tuberous-rooted plant, producing fronds from 12 to 18 inches in length. The pinnae are narrow, oblong-acuminate, and at the base slightly cored on the upper margin, and crenate; colour light green. This is a very elegant dwarf-growing species. It sheds its fronds in winter, and care must be

taken that the tubers are not dried too much, or they will be found in spring quite dead. Native of West Africa.

N. ENSIFOLIA.—A robust handsome plant. Fronds pinnate, from 12 to 30 ins. in length, and somewhat pendulous. Pinnae about 4 inches long, sword-shaped, and bright green. It forms a beautiful specimen in a pot, but displays its full beauty when climbing over rockwork or upon an artificial pillar in the stove fernery. Native of the East Indies and South America.

N. EXALTATA.—This is perhaps the commonest species of the whole genus, but at the same time one of the handsomest. It succeeds admirably in almost any situation, but if planted out it must be checked from extending itself to the detriment of the other plants. Its fronds are from 1 to 3 feet in length, or even more, and some 3 inches broad, linear lanceolate, serrate at the margins, cored at the base on the upper

Nephrolepis exaltata.—Part of frond full size.

lanceolate, serrate at the margins, cored at the base on the upper

side, and bright green. It seems to be widely distributed throughout tropical America and the West Indies, and is also found in the Sandwich Islands.

N. FALCIFORMIS.—A rare species, and its rarity is much to be regretted, for it is robust and handsome. The fronds are from 2 to 3 feet long, erect, and arching. The pinnae are broad and falcate, slightly corded at the base, and dark green; the sori are nearly round, and situated in a single row close to the margin. It cannot be too highly recommended for climbing over rock-work, and it also makes a fine specimen as a pot plant. Native of Borneo.—**ESPERO CREBIA.**

WORK FOR THE WEEK.

KITCHEN GARDEN.

DURING frosty weather wheel manure on to the different quarters that require it; throw it into convenient heaps, and cover it with earth like a Potato pit, so as to prevent waste from evaporation. It greatly facilitates spring cropping to have the manure at hand, instead of having to wheel it when wanted. Soil that has been ridged up would be benefited by the ridges being turned over with a fork, the more fully to expose it to the action of frost. Turn compost heaps of all descriptions; one turning in frosty weather is worth three in the absence of frost. The occupation of the ground by crops suitable as food for a variety of insects, in the course of a series of years brings a vast number of such depredators into a garden. The invention of methods for their extirpation often taxes the ingenuity of a gardener to a considerable extent, and caution must be exercised in the choice of material. There is, however, one substance not open to any objection, and which may now be used with advantage to land whence the crop has been removed—viz., lime. Ground cropped in the preceding season with Carrots, Parsnips, or Potatoes, and found, as is frequently the case at this time, infested with insects, should have a good dressing of lime dug in; or if that cannot be afforded, the soil should be turned up in ridges for the winter. Birds are the natural enemies of grubs. The services of a few rooks or sea gulls, where they can be secured, would be found of no inconsiderable value. Take advantage of dry days to tie advancing *Endive* to blanch. *Globe Artichokes* should be thought of. Examine young *Lettuces* frequently, and dust with lime or soot to check the attacks of slugs. A stock of leaves should be variously distributed amongst those crops requiring protection. A reserve of leaves should be kept on hand for *Sea-kale* covering, linings, &c.; in fact, a good heap of leaves is one of the requisites of a kitchen garden. As this is the season alterations in estates are generally in progress, the opportunity of collecting soil or material suitable for storing for the garden should be taken advantage of. Turf, road sand, and brick rubbish, are all valuable, and the chance of making a reserve of such should be eagerly taken.

FRUIT GARDEN.

Proceed with the planting of fruit trees in open weather, and if the soil is old let each tree have a good portion of new soil about its roots. Pruning and nailing all kinds of wall trees, except Peaches and Apricots, must now be vigorously prosecuted. Leave nothing for the spring which can be done now; every day gained at this season will give greater liberty for extended operations in the spring.

FLOWER GARDEN.

A little labour will secure a valuable supply of material for enriching the flower beds and borders. Leaves are everywhere at hand; they should be sedulously collected and stacked in some out-of-the-way place with a mixture of road sand or light soil, rotten sticks, and decaying vegetable matter, and left to ferment. In a season or two a most valuable compost will be the result, especially suitable for many of the shrubs and plants which decorate our gardens, whose original position was probably near some primeval forest, the ever-accumulating leaves of which would naturally give a character to the surrounding soil, and encourage the propagation of *Rhododendrons*, *Azaleas*, *Magnolias*, &c. A thorough cleaning should once more take place in all pleasure grounds, as by this time all the decayed leaves are down. Rose stocks may now be procured and planted; they will transplant safely at this period, provided the roots are kept damp. *Fuchsias* in beds or borders may be cut down and mulched over; if it is desired to preserve any large specimens with their tops, a row of stakes may be driven round in a circle and surrounded by a mat, the interior being stuffed loosely with clean new straw. The top of this

may be thatched to exclude wet. Before enclosing, however, it will be well to pluck off the leaves, as these encourage mouldiness.

GREENHOUSE AND CONSERVATORY.

In frosty weather the conservatory will require very careful management, for some rather difficult problems have to be worked out. Atmospheric humidity cannot by any means be entirely dispensed with, yet if not well managed it will produce damp, which is very prejudicial to the delicate texture of *Camellias* and other gay flowers. Of course, if the exterior of the roof has no eaveing ice will gather on the glass, and in melting will drop from the laps. The best plan is to keep as low a temperature as can be allowed—say, 40° to 45° at night, and to give a little back air at night, also a little at front, but it must be very moderate, as the atmospheric moisture, instead of passing quietly away by the back apertures, will be condensed as it rises. With a good roof-covering, 40° would be quite sufficient, and then there would be enough atmospheric moisture at all times without the special application of water. See that the young stock of *Heliotropes*, *Scarlet Pelargoniums*, *Persian Cyclamens*, with other flowers grown especially for winter, have light situations, and regular, close attention as to watering. Let *Eucyas* also have attention in watering; if they stand near flues or pipes they may become suddenly very dry. Keep up a quiet ventilation in the greenhouse day and night if possible; let the air steal in moderately, and dispense with strong fires, or, indeed, fires of any kind when the temperature can be kept within the limits without them. Do not water the *Pelargoniums* until they are thoroughly dry, and take care to fumigate frequently and slightly.

FORCING PIT.

This is a good time to introduce the following plants, provided, as before observed, they have received the necessary treatment through the summer:—*Rhododendrons*, *Azaleas*, both American and Chinese, *Persian Lilacs*, *Sweet Briars*, *Moss* and *Provence Roses*, *crimson* and *Perpetual Roses*, *Lebanus*, *Kalmias*, *Anne Blyen Pinks*, *Wallflowers*, *Sweet Williams*, and *Dutch bulbs*. Unless, however, they are in proper trim, it will be labour in vain, and no mode of forcing nor form of pit can compensate for this. If the heat is wholly produced by fermenting materials, keep down accumulating damp and mouldiness by an almost constant ventilation, increasing the linings in order to raise the necessary temperature. Those who possess tank-heated pits will pursue a somewhat different process; such will scarcely need my advice. If there is any prospect of a scarcity of bloom next May, a portion of the *Achimenes* and *Gloxinias* should be repotted at once and placed in the forcing pit, choosing such as have been the longest at rest. A few *Clerodendrons*, *Allamandas*, and *Eclites splendens* may also be started, but unless plants of those with well-ripened wood are at command, and that have been some time at rest, there will be nothing gained by attempting to start them into growth at present, for in most cases it is difficult at this season to maintain a sufficiently warm temperature to secure anything like free growth from these unless the plants have been well prepared for an early start. A gentle bottom heat of about 80° or 85° will be of great service to such plants, in inducing a healthy root-action.

PITS AND FRAMES.

If former directions have been carried out the plants in these structures will present a dwarf and robust appearance, thus being well fitted to bear deprivation of light for some time, if severe weather should ensue. Damp has accumulated very much of late, owing to the heavy rains and the dense fogs with which we have been visited. This may be removed by giving air at the front and back on sunny days, but where the pits are heated with flues or pipes, a dry atmosphere may be obtained by putting on slight fires, at the same time allowing a free circulation of air amongst the plants.—**W. KEANE.**

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

OUR work was very much the same as in previous weeks' notices, in the way of protection, forcing *Sea-kale*, &c.—wheeling during frosty mornings, preparing heaps of fermented material, digging, trenching, and covering *Asparagus* with a light layer of dung and litter, as the roots are rather near the surface.

As yet the frost has not been so severe as to render *protecting Celery* necessary, but after such mildness of weather it will

be more easily injured. What we planted late has gone on better than we expected, owing to the mild weather. We could not plant earlier, having no water to give. Our earliest beds, protected from the drought by shading, have done very well, not showing a single bad or bolted head.

Large Lettuces are so placed that protection can be given; younger ones and smaller Endive are doing well, especially on ridges. Young Lettuces sown late often stand the winter well, when sown rather thickly on ground merely-scratched over, not dug or forked-up; the firmness of the ground is a great means of giving firmness and hardness to the young plants.

FRUIT GARDEN.

More care than usual is required in the *fruit-room* this year. Apples, on the whole, keep remarkably well. Pears keep worse than usual, and ripe earlier. One fruit allowed to rot will soon injure a lot more in its vicinity, especially when the room a command will not permit of the fruit being laid down separately. Why should there be such a difference in the keeping of Apples and Pears this season? We might suppose in the case of the Pears, that after swelling but little in the dry hot weather, they swelled too rapidly after the damper weather came, and were thus overcharged with watery juice, and early ripening and decay were the consequences. But, then, why would not a similar cause act on the Apples, which, on the whole, are keeping as well if not better than usual?

Late Grapes we find want frequent looking over, as each tuted berry is likely to taint the next to it. As soon as the leaves turn yellow they should be removed, at first the most yellow ones, as whilst any green remains they keep up a slow up-movement, and in orchard houses where there are late Grapes, the leaves above the bunches, though the leaves are turning yellow, act as a protection to the bunches in sudden changes of weather. Unless, however, where there is some simple mode of heating so as to keep out frost, it would be well to clear orchard houses of fruit by the beginning or middle of November, as a little frost soon injures a bunch of Grapes. There is no difficulty in this respect in a heated house, as a little fire will easily keep the temperature at about 40° at night. At this season a little fire with a fair amount of air will be desirable every day, except in bright sunshine. Unless frosty, very little firing should be given at night, and unless the frost is severe, a little air should be left on the house all night. Very little air will prevent the enclosed atmosphere becoming stagnant. If a fire has been put on in the morning and burns brightly, and the sun is also bright, the air of the house may become too dry, so as to scorch and shrivel the berries. In such a case, instead of admitting too much cold air, if frosty it may be advisable gently to dew the paths, stages, &c., from a fine syringe, so as to counteract the extra dryness. This will seldom be needed except in such a case as the above, where bright sun heat and strong fire heat are allowed to meet and work together, which should in every case be avoided. As a general rule damp is the thing to be avoided, and hence Grapes will always keep best where no plants are put in the house, with their necessary and attendant waterings. Where plants had to be put, as in a greenhouse, with Vines on the roof, and where it was desirable to keep some bunches as late as possible, we have seen this well managed by enclosing the bunches in bags, large for the size of the bunch, made of silk paper, or book-muslin, so glazed with starch, &c., as to keep out the damp. A small opening in the bag was left at the stalk of the bunch, so that the air round the bunch should be in movement, whilst the damp of the house could not act freely upon it.

Many will now be thinking of commencing to force Vines, Peaches, &c., but the majority of those for whom we write will do little in this way until the turn of the day, or until January and February are pretty well gone. In all such cases there will not be such a difference in the ripening time as would in an economical point of view compensate for the greater trouble and outlay. There will be some, however, who will grudge no expense to obtain early results, and they cannot commence too soon after the houses are thoroughly cleaned, as lately advised and commented on. It must be kept in mind, especially at this dark season, that the temperature of such houses should be raised very gradually, and rather more moisture should be given in the house by syringing than would be actually required by the increased temperature until the buds have not only swelled but burst. Some persons boast of doing their forcing in a slap-dash manner, raising the temperature quickly, and acting somewhat in derision of the slowcoaches, who are frightened at a good heat. Slow and sure, we would advise all beginners to take as their motto. If they begin with a vine

at 45°, let them take a week to raise it to 50°, another week to 55°, and keep the house ranging from that to 63°, until the buds have swelled and broken.

Pruning the hardier fruit trees, nailing, &c., may be proceeded with now in all favourable weather; we dare not prune so much as we wish, owing to the ravages made on our fruit buds by birds and other fourlopers. We suppose that there are always some disadvantages to be met with everywhere. Trying to preserve the buds of fruit trees has been a serious matter with us for years. Even now some fine pyramid Plum trees, bristling a fortnight ago with fruit buds, are already greatly injured. Wherever feeding game largely close to a garden is followed there will be multitudes of four-footed and winged depredators when the most telling means of defence are prohibited. During the summer we visited a garden nearly as much surrounded with wood as this is, but where we know as a fact that scarcely a fruit bud or a fruit is ever touched. On our visit ventilators, close to the ground, of vineries were left open night and day. Had we done so for a single night we should have expected a scene of desolation in the morning from mice, rats, and birds, not to speak of less birds, even thrushes and blackbirds delight to get at a bunch of Grapes. Whence the difference? Partly because there was no attempt to feed or bring up game in the neighbourhood of the garden, but chiefly owing to a number of cats, that were eating their allowances of scraps from the kitchen behind one of the sheds. The cats were so fed that they had little temptation to go beyond the garden, and at the same time were not so overfed but their presence and walking about kept even birds at a distance, whilst mice were kept out of sight. The claws of a cat or two are the best of all vermin traps in a garden; but in many a garden cats, however tamed, domesticated, or even ringed or chained, must be denied a home. There is no doubt that when given to wander, the cat is a sad rover in a game preserve, but well treated, as in the garden just referred to, we have known them help for years without staying much beyond their allotted boundaries. Besides, when kept, as a matter of course, it would be easy when used to it to shut them up at night. Although no doubt there are many exceptions, yet it may be laid down as a general rule, that when a cat is disposed to wander, it abuses those hours for its purpose when its master or mistress has gone to bed. A cat is not all gain; even in a garden it will search a little at times; but for catching and deterring in a kitchen and fruit garden, a good cat is worth its weight in silver. How many of our readers are now distressed about their buds in their little gardens being destroyed? They may trap and poison as they will, but there is no such security to be found as in a watchful cat.

On the same day that we saw the cats in one garden, we saw a sight in another garden which we shall never forget. Mr. Sage, at A-bridge, had taken off the lights from a large lofty beam-to Peach house. The Peaches were a fine crop, all nicely arranged, and fully exposed on the upper side of the trellis, swelling, colouring, and ripening well. With such a complete exposure we could fancy how rich the flavour would be. Had we had a similar house, we should not have ventured on similar treatment. In a single day we should have expected every fruit to have had a hole in it. Even on leaving a door open for more air, not to speak of less intruders, we have had pheasants visiting, thinking, no doubt, they might have a taste as well as their betters, and smashing the glass to escape when discovered. In that large kitchen garden we did not observe a single bird. We could recollect of a garden where you could scarcely traverse a walk without a dozen blackbirds screening out defiance, and vaulting over a wall only to come again when your back was turned.

ORNAMENTAL DEPARTMENT.

We must here content ourselves with a few hints. First, to window gardeners. Keep leaves and stems thoroughly clean by freeing them from dust, and softly washing with clear water at from 60° to 65° in temperature. If you try Chinese Primroses, do not over-water them, and keep the water from the collar of the plant. If the water gets into the saucer empty it out. As respects Scarlet Geraniums, unless in bloom, they will need little water. If you try Cinerarias, if you do not put a little moss in the saucer, you may allow about the eighth of an inch, if not more, of water to remain in the bottom, and you cannot sprinkle the foliage too often if there is fire in the room. If you use bulbs, keep them in the dark until roots are freely formed, and the flower-stems showing, then the more light they have the better. True, they will come all the sooner if kept on the chimney-piece, or near the fireplace, and they will even

bloom there, or on a table, or any corner where you choose to set them; but all this will be done chiefly at the expense of the stores laid up in the bulb. Would you enjoy the beauty of the bulbs in connection with the feeling that you are doing what you can to make them comfortable, then let them expand their blooms in all the direct light you can give them.

Plants in frames and cold pits will scarcely need a drop of water. In particular cases take the plant out, water, and when drained replace it.

In plant houses avoid over-watering and over-heating, and spill as little water as possible. In dull cold days a little fire heat with air will be more useful than much fire heat at night, when it can be avoided. Unless where plants are to be forced, proportion heat to light as a great rule not to be departed from.

Laurels and Emergents.—We pruned and cut these down, as the leopius were wanted for a particular purpose. As in the case of a correspondent the other week, the Laurels here, to be kept healthy and vigorous, require frequent lopping and cutting. In ordinary winters all such work may be done safely now. If we were sure of a very severe winter we would prefer doing such work rather late in spring, just before the sap begins to rise freely. In cutting large limbs now it is advisable to dab up the cut parts to prevent frost exposure and cracking. Clay and a little lime as a thick paint do very well, a little oil paint does better. When the fresh shoots break from beneath the cut part all danger is over, but we have seen stems of Laurels from 4 to 6 inches across killed to the ground from wet and severe frost acting on the exposed cut end.—R. F.

TRADE CATALOGUE RECEIVED.

Dick Reade & Co., 129, High Holborn, London, W.C.—*Illustrated Sheet of Horticultural Decorations.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

Books (C. Bell's).—Lowe's "Ornamental-foliated Plants," contains coloured plates; any bookseller can obtain the volume for you.

REMOVING PEAR TREE (Amateur).—Remove it immediately, injuring the roots as little as may be, mulch over the roots. Graft a portion of the branches next spring, and the remaining branches the year following.

PYRAMIDAL TREES (J. Lawson).—If you write to Messrs. Rivers & Son, Nurseries, Sawbridgeforth, they will tell you.

LEAVING GERANIUM CUTTINGS IN THE OPEN GROUND (C. J. S.).—We do not think the cuttings will survive the winter, though they grow in a sheltered spot, and are to be covered with fern or hay in severe weather. It is, however, worth a trial—that is, if you can spare the plants.

AZALEA LEAVES TURNING YELLOW (Julie).—Do not despair. The plants at this season usually lose a portion of their leaves, and there is no great harm in it, only keep them cool so that the injury will be needlessly started into fresh growth before the flowers expand. The Madame Saundersii, for which you have no stove, keep in the warmest part of the greenhouse, and give but little water—only a little occasionally to keep it fresh. We have it now in fine bloom in a stove.

TRANSPLANTING LARGE MAGNOLIA (W. W. M.).—We think you have done all that could be done, all that we consider needful to ensure success, which we think you have good reason to hope. Much larger Magnolias have been moved successfully. See that the wires you employ for keeping the plant steady do not chafe the stem. Protect the stem with hay, and wrap it in one from the base upwards, fully two-thirds of its length. It will help to assist the flow of the sap in spring.

ASPARAGUS KALE (L. M.).—The part that gives the name of Asparagus to this desirable vegetable are the side shoots, that will by-and-by make their appearance, and when 3 to 6 inches long they are broken off like Brussels Sprouts; and when cooked whole and kept in brine in the dish have a nice appearance, and are very delicate with a slight Asparagus flavour. The heads you now think of cutting are very good cooked like other kinds of Borecole. There is no substitute for Asparagus, nothing that has an appearance like it, or can be mistaken for it in flavour.

PREPARING GROUND FOR ONIONS (Idem).—The soil being poor, give a good dressing of manure and dig it in deeply and well now, throwing the ground up roughly for the winter. In February throw the ground level, forking it over on dry frosty mornings; early in March mark out spaces 4 feet wide with 1-foot alleys between, and give the beds a coating of very rotten manure about an inch or two thick, and pack it in with a fork. If you think fit you may give each bed of 13 yards in length a bushel of pounded charcoal; then throw out the alleys over the beds, rake level, and sow in drills about 6 inches apart in the second week in March.

LEAVING SALSIFY IN THE GROUND (Idem).—It will not injure Salsify to leave it in the ground, but it is much better taken up and stored in sand in a dry shed. It is then always at hand for use as required. The

soil cut and stacked last March will be better than that fresh cut for many purposes, but for border-making and plants not requiring frequent shifting we like turf fresh.

PLANTING HOLLIES (Commander).—The height of stem to be covered with soil is simply no more than is required in covering the roots with soil—not more than 3 inches. That depth of soil over the roots is quite sufficient, more is injurious.

PLANTS FOR A STOVE (Idem).—There is scarcely any plant that will not succeed in a stove with a temperature in winter as low as 55°. We give a few names of the most select, both for foliage and also for their flowering. For foliage: *Abocasia metallica*, *Ananas sativa variegata*, *Arceuthobium*, *A. Verschaffeltii*; *Clanum asperatum*, *China borea* Ernstii-Angustii, *Cocos coronata*, *Cissus discolor*, *Croton bicoloratum variegatum*, *C. irregularis*, *C. intertrupta*; *Craonophyllum maculiferum*, *Cycas circinalis*, *Dialium Pearcei*, *D. Weltri superba*; *Draena ferrea*, *D. stricta*, *D. Cheisoni*, *D. regia*; *Ficus dubautia*, *Maranta illustris*, *M. roseo-picta*, *M. Veitchii*; *Musa Cavendishi*, *M. En-ete*; *Pandanus javanicus variegatus*, *P. elegantissimus*; *Synedrella nobilis variegata*, *Terminalia elegans*, *Thrinax elegans*, and *Verschaffeltii splendens*. For flowering plants: *Allananda grandiflora*, *A. S. Schottii*; *Anthurium Schimperianum*, *Ardisia crispifolia*, *Bougainvillea planicaulis*, *Burchardia major*, *C. robustiorum* Polakianum, *Cyatula lucida*, *Cyatocarpus richardsonii*, *Calceolaria R. Robinsonii*, *Eucalyptus amabilis*, *Euphorbia japonica*, *Fraxinea confertiflora*, *Gardenia cuthbertii*, *G. fluida*, *G. radicans major*; *Gesneria exoniensis*, *Hoya bella*, *H. carnea*; *Ipomoea Horsfallii*, *Ipomoea caroliniana*, *I. coccinea* Zapfen, *I. fluida*, *I. javanica*; *Jasminum gracilis*, *Mexantia erecta*, *Medinilla magnifica*, *Rosea gracilissima*, *Rondeletia speciosa major*, *Stephanotis floribunda*, *Tournefortia asiatica*, *Vibea alba* and *Vibea rosea*.

PERLWARTIA LEAVES SPOTTED (Thos D.).—The only remedy for the spot on *Perlwartia* leaves is to remove the diseased part, moisture on the leaves. The moisture may be wintered a close thin glass or condensation. Your only remedy is to give them a position near the glass and a slight abundance of air, keeping the atmosphere as dry as possible; indeed a little air at night, so as to keep the moisture from condensing on the leaves, is good. Water carefully. A temperature of 41 to 45 is sufficient at this season.

CLEMATIS AND PETERRA PLANTS LIVERY (Thos D.).—V's would keep the Clematis at the root from now until February, not, however, so dry, to cause all the leaves to fall, and then we would cut it back, giving as a much better time to heal back than at the present. The Peterra, but we would not root, though you may do so, and secure more plants. We would let the shoots grow until long enough to be detached, in order to make new plants.

FRANSES FOR LATE USE (J. T.).—Your Peach tree, from the description, is probably Late Admirable. The stringing earth is as late, if not a later kind. Barrington is also good, but not so late. Waltham Admirable is late, but is a shy bearer. Lord Palmerston and Lady Palmerston are first-rate late sorts, new kinds raised by Mr. Rivers.

BLENDS FOR A GREENHOUSE (C. B. M.).—The samples sent are more suited for protecting well trees than for blimes for a greenhouse. If you want to keep it cold, we should prefer No. 1. For placing inside as blime, we should like the picture; they look so snug. Merely to break the force of the sun nothing is better for the inside of a house than black-melina, hoisted and stretched in pieces by rings. Such blimes would require to be removed from October to April. Perhaps we do not quite understand your aim.

GREEN VINERY (C. B. M.).—There can be no doubt of ground vineries being a success. From 7 to 9 feet is a good height for one Vinery; by adding several you can make what length you like. By raising the frame or pillars in the ground, you can make the ground enclosed so partly at least for the roots. Covering the ground with dirt is useful for retaining heat, and if the slate be painted with sulphur it will keep the Vinery free of some enemies. We care little as to the different merits of wood and brick, only in stony weather the brick retains and gives out the heat longer. One Vinery would do for a length of from 7 to 9 feet. If we were to plant in the second manner, we would cut back the Vinery to, say, a foot or so after planting, and grow to the roof the first summer. You can easily purchase strong Vines that would beat the first summer, but to succeed you had better plunge the pot, then break it all round, and surround with the good compost; or if you plant in, do not disengage the roots much. The hardest sorts are the best—such as the Black Hamburgh and the white Royal Muscadine. All the hardy kinds will succeed. The simplest mode, as in the earthen's Vinery, is to leave the ventilation on all the summer. The partitions between the Vines might be partially shut up in winter, if you prefer to other things inside or outside. You will get information on these little places, and on growing Vines generally, in the "Vine Manual," published at our office by G. S. We would by no means think of having a row of your entrance in a row of ground vineries, but if we had a wall or wall facing the south, and that fence was 7 feet or more in height, we would sooner plant it with glass, and then you could walk inside and tend to the Vines in all weathers.

PLANTING VINES IN A HOUSE (L. Poor Working Man).—By planting inside you will avoid many evils which we are forced to contend with. You may have all the border inside if you like. You may let the roots outside to, if it is suitable to have a border there, by having the front sill on planks or benches. The method of forming the border is correct, only you should have a drain beneath the rubble. You need not sink down much, if you can easily raise the border above the ground level. If it were to be a wall to have a border outside, and you were under the necessity of having the roots all inside—a cool plan when watering and rich substances and being attended to—then, even if we used the whole of the floor for a border alternately, we should be satisfied with the present proposed arrangements, and in three or four years we would add a bit more to the border inside, and that would be the giving cattle a fresh pasturage. If you have room enough above, there will be no benefit in taking out a deep hole for the border. You must do so to a certain extent, we presume, to secure the drainage.

FUEL FOR FIRELESS STOVE (M. L.).—Neither that you mention nor any other can be burnt in a conservatory, greenhouse, or any structure containing plants without burning those plants. All fuel when burnt produces carbonic acid gas, and this in excess causes the leaves to turn yellow, and to some plants brings death.

IRISH PEAT CHARCOAL.—Several correspondents ask where they can purchase Irish peat charcoal, so strongly recommended in Mr. Cuttill's manual of market gardening. Anyone who can supply it would be repaid for advertising it, stating price, &c.

TAKING UP GLADIOLI (Bertram).—Your soil being "black loam, subsoil sand, on the Mansfield stone," there will not be any danger of leaving them in the ground, but we would top-dress with partially decayed leaves.

VARIOUS (Amateur).—1. The cause of the Calceolarias, Tom Thumb Geraniums, and Lobelias doing so badly in your soil, is no doubt want of limans. Give it as much leaf soil or well-rotted manure as you can now, and work it well into the ground, digging to a good depth. 2. The glass placed before the Calville Blanche cordon Apple trees should be removed from now until spring. 3. Having no greenhouse, your only plan of forwarding Tomatoes and Celery is to sow the seeds in February, and growing the plants in a hotbed, pricking off the Celery into pans when large enough to handle, and potting-off the Tomatoes in small pots, growing them in a hotbed, and hardening them off by May. 4. Budded and grafted Pines, Pear, and Apple trees may be moved in the autumn succeeding their working, and in the case of grafted trees, will be maiden trees, but the budded ones will not be maidens until the autumn following, and it is well not to move them until they have made a year's growth. 5. Quince stocks are propagated from cuttings and layers, and also suckers, choosing young wood for both the cuttings and layers, and planting or laying off once. The Paradise Apple stocks are raised from cuttings, putting in in February cuttings of about 10 inches in length, with a short heel of the previous year's wood.

POUNDED OYSTER SHELLS FOR CINERARIAS (One Anxious to Learn).—It is well to mix them with the compost in the proportion of about one-sixth, but they should be calcined. They are not equal to watering with liquid manure; but watering often with that is not good for anything, unless the liquid is very weak. Giving it twice or thrice a week is quite often enough, and we find one good watering better than constant applications. The plants require time to elaborate the food given them. It is necessary to give both the oyster shells and liquid manure, the latter when the pots are filled with roots, at every alternate watering, or once or twice a week. Oyster shells are good for mixing with the soil for Chrysanthemums, also Felargoniums, and almost, if not all, pot plants, except those, perhaps, that require peat soil.

CHRYSANTHEMUM SEED SOWING (Berthampstead Subscriber).—Sow in March in pans of light sandy rich soil, and place in a hotbed. When the plants appear give abundance of air, and keep them near the glass. When large enough to handle prick them off about an inch apart in pans, and return them to the hotbed or a cold frame. Shade them for a few days, then harden them off, plant out in June in an open situation, and water them in dry weather. In autumn the plants may be taken up and potted, and be wintered in a cool house or frame. They will need to be potted and then growth encouraged the second year, and in the autumn they will flower. The "Encyclopedia of Gardening" is published by Messrs. Longman, price 3s. 6d.

CLEANING NEGLECTED GARDEN—FRUIT TREES UNPRUNED (E. M. J.).—As the soil is good we would not burn the top spit, but at once trench fully two spits deep if the soil is good to that depth, or as deeply as you can without bringing too much of the bad soil to the top. If this were done between now and February, the ground would be in first-rate order for planting with Potatoes. The leaf soil will answer very well as manure, placing it over the Potatoes in the drills, and we would supplement it with guano, at the rate of about 3 cwt. per acre. It would give them a start. Sow it broadcast. The wall trees thirty-five years old we would grub up, and replace with younger trees. There is poor chance of your cutting them into form after being so long neglected. We would not plant fruit trees after February, if we could help it, but have planted very successfully in March. We would trench the borders, and clear out all the old roots we could find. It would be well to dig a hole for each tree, and pave the bottom; it would cause the roots to spread, but would not prevent their going down; to prevent their doing so the interstices between the stones should be filled up with concrete. The planting with chopped sods and fresh soil is good, top-dressing with rich manure. For a south and east aspect in the north midlands of Ireland, we advise for the south wall:—*Apricots*—Hemskirk, Kaisha, and Moorpark. *Peaches*—Noblesse, Grosse Mignonne, Violette Hâtive, Malla, Barrington, and Early York. *Plums*—Early Favourite (Rivers's), July Green Gage, Green Gage, Jefferson, Transparent Gage, and Angelina Burdett. *Of Pears*, for the east wall, *Beurré d'Amaldis*, *Calebasse d'Été*, *Marie Louise*, *Gloa Moreau*, *Dr. Troussseau*, *Beurré Diez*, *Beurré Bachelier*, *Beurré d'Arcenberg*, *Beurré de Rance*, *Winter Nclis*, *Joséphine de Malines*, *Van Mons Leon le-Clerc*, and *Ne Plus Meuris*. If you wish for more *Plums*, *Belgian Purple*, *Prince Englebert*, *Ondlin's Golden*, *Victoria*, *Kirke's*, and *Coc's Golden Drop*, will suit; and if for *Nectarines*, *Etrange*, and *Violette Hâtive*, will succeed on the south wall.

PRUNING DWARF FRUIT TREES (An Amateur).—We should not prune more than is necessary to give them the required shape. The less pruning bush and pyramid fruit trees have in winter the better. Of your two plans, we consider the pruning but little the better, and we think the notching over the buds will not interfere with their breaking. The inverted \cup is the proper way to cut the notches; the straight cut, or directly across, is more likely to result in the shoot being broken above the bud at the cut. We question very much the soundness of the notching system. In the end we fear it will lead to gumming and canker, and if not, the shoots will ever be liable to breakage.

HELIOPTROPE LOSING ITS LEAVES (Arlins).—It is usual for the Heliotrope to lose its leaves at this season, and it is well to give no more water than a little occasionally to keep the wood firm. The plant ought to have a temperature of not less than 35°, and if you require flowers at this season, 45° to 50° are necessary, the soil being kept moist, and in favourable weather abundance of air given. The plant, however, ought to have rest by being kept cool, yet safe from frost, and comparatively dry at the roots, pruning before it is again excited into growth. Thus treated, it will grow and flower more freely and strongly than when otherwise managed. We are unable to account for the Roses in pots throwing out shoots about half an inch long and then withering. Are they not potted with the junction of the stock and scion above the soil? It ought in all cases to be covered with soil.

CORREA LEAVES FALLING (Delta).—It is a result of imperfect root-

action, and may be caused by bad drainage, giving too much water, and so saturating the soil, and sometimes by want of water in summer. The chief cause, however, is scale, which, by its secretion, causes honeydew on the leaves, and their pores being closed they fall. The temperature in which the plants are is too high; 40° to 45° will be sufficient at this season, and with that, a light, airy situation, and water enough to keep the soil moist, the plant does well. The hot dry season has been very trying to all plants of this class. In summer it is desirable to grow them in a cold pit. Keep your plant dry, giving no water except when the soil becomes dry, then supply enough to show itself at the drainage, and we think it will recover. Repot in March, and keep the plant cool with plenty of air.

FORCING SPIRÆA JAPONICA (G. O.).—The plants will flower early in February if placed, at the beginning of December, in a house with a temperature of 45°, increased to 50° in a fortnight, and then to 55° in another fortnight, if afforded a moist atmosphere and the needful supplies of water. The temperatures named are from fire heat.

SNOWBERRY AND CORCHORUS JAPONICUS PAUNING (E. M. J.).—It is scarcely possible to prune these so as to look well. The only plan that we know is to well cut out the old wood, and then prune the parts remaining, so as to form compact bushes. The long shoots of the current year may be cut in one-half or two-thirds their length, and the side shoots shortened much in the same way as Roses. The Snowberry, however, need not have the side shoots shortened; thinning them and shortening the long and straggling shoots will be sufficient. If they have spread considerably from the main plant by suckers grub these up, leaving the most compact bushes. Spring is the best time to prune the Corchorus. Just before it begins to grow, and any time during the winter, will suit the Snowberry.

PEACH TREES INFESTED WITH BROWN SCALE (J. R. D.).—The trees being at rest, paint them with a solution of 8 ozs. of soft soap in the gallon of water, applying it with a brush at a temperature of 120°, and being careful not to dislodge the fruit buds. A few syringings with water at a temperature of 100° will answer quite as well, but the soft soap is a great antidote to the attacks of red spider. Allowing the house to be open when frosts prevail is a capital means of keeping down insects. Clarke's and Gisburt Compound will also destroy the scale.

STARTING PINES (Idem).—The plants you wish to start for fruit in spring ought now to be kept dry, if for no other reason than the low temperature you are giving them; but that, with the dryness, will hasten their starting for fruit in spring. We would not place them in the cucumber house before the beginning of February, keeping them dry until then. It is likely they will fruit as you wish.

POULTRY, BEE, AND PIGEON CHRONICLE.

THIS SEASON'S MOULT.

MANY of my Dorking chickens have gone entirely through the moult, having changed, I believe, every feather. This has especially been the case with a very fine cockerel that I intended exhibiting, so that as it prevented my doing so when I wanted, I took especial notice of him, and I do not think he has a chicken's feather left. I never saw chickens in such a naked state before, and have often wondered at the cause. They have had no stimulating food for months.

I am afraid Mr. Wright's plan to stop pullets laying will be in many cases very difficult to carry out; at least, it will be so in mine, as I have only one large grass run over which all my fowls stray; therefore, I do not see how I can vary the scene; but, nevertheless, the idea seems very good, and is borne out to some extent by the very common fact of a laying hen being removed to a fresh place; in many cases this will at once stop her laying, and if the change will stop a hen laying, it is very likely to put off the laying of pullets. My plan hitherto for this purpose has been to leave off stimulating food as soon as possible after the chickens leave the hen. Of course, this must be done gradually.—T. E. KELL.

CRYSTAL PALACE POULTRY SHOW.

THIS Show was opened yesterday, and whether for numbers, or in some of the classes, for quality of the birds, must be ranked this year as one of the best, whilst in Pigeons it has eclipsed every other. The darkness of the day, and the late hour at which the awards were concluded, prevent our criticising the later classes as we could wish, but of the main classes we are able to give something like a correct description. In going through the Show we recognised many of the Birmingham competitors, and the condition in which these birds were shown reflects the highest credit both on the Birmingham and London Committees. We were also much struck with the suitability of the Palace for a poultry show, the diffused character of the light showing nearly all the classes to good advantage. In only a few was the light bad; and the very worst-placed tiers could be far better seen and judged than many ranks at Birmingham. Partly owing to this, and partly to the smaller classes, there was on the whole much more satisfaction with the judging.

DORKINGS.

1.—The cap for old Grey Dorkings was taken by Mr. Martin's well-known Rose-combed pen, combining grand size with remarkably good legs and feet. Though not yet quite at their best, these birds seem hard to beat. Second and third, good framed single-combed birds

and deserving their honours. One of the highly commended pens hardly deserved notice, and pen 7 contained a good pair of birds, but not yet through the moult.

2.—First and second prizes for cockerels were taken by same exhibitor, with fine birds in good condition, fully bearing out our remarks at Birmingham. Both in better order than at the latter show, but promise better still. Third, a tolerably-framed and very dark bird. The highly commended mostly well given, but 28 must have been meant for 29. Dorkings are decidedly not equal to former years, but this was a very fair class.

3.—First-prize pullets had large frames, but not at all matched in colour. Second contained one very fine bird, but the other much inferior. Third only middling. This class not nearly equal to the cockerels. Pen 64 contained one very fine pullet, and pen 67 appeared likely to make a good pair of hens. Several birds in this class appeared uncommonly much out for pullets, but we could not thoroughly satisfy ourselves of any deception.

4.—First-prize Silver-Greys were a medium size, but very handsome cock, with a hen of massive frame, but hardly clear enough in colour. In the second and third prizes the best cock was with the worst hen and vice versa.

5.—The cockerel class confirmed the opinion we formed at Birmingham, that this breed is advancing. The prizes were very well indeed, but pens 85 and 87 deserved mention before either of the highly commended pens.

6.—The pullets were again not equal to the cockerels, the colour appearing more difficult to breed.

7.—The first-prize White Dorkings were in truth a fine pair, both large and white. The second cock very yellow, and hen very dirty, and on the whole we preferred the third prize. The highly commended pens, except 117, struck us as very poor.

COCHINS.

8.—The old Buff Cochins were only five entries, and the third prize was deservedly withheld, only two pens being good. Cup pen a grand shaped cock, but with rather doubtful hocks, and all the tail pulled out; hen too long in the leg. Second wanting in shape.

9.—First prize a fine bird, but again all the tail gone, and rather neatly in wing. Second would also look better with more canal appendage, but in his case the deficiency appeared natural, the feather being only half grown; we liked this bird much, and were his wings quite small, and himself a month older, we question if he would not have had the honours. Third a dark bird, very promising for his age, and honestly shown. No other bird very first rate.

10.—In Buff pullets the Birmingham decisions were reversed, Lady Gwydyr's cup pen there being now put second, and first given to the Birmingham fifth-prize. We did not like the alteration, for though Lady Gwydyr's pen was as we said, anything but a match, and one bird not so even in colour as might be, they were both far better in shape than the others. Third-prize and all the rest very poor, and we repeat our remark, that the Cochins as a whole are deteriorating sadly.

11.—First-prize old Partridges very good, but nearly all the birds in this class very poorly feathered, except one bird with a suspicion of hocks.

12.—First-prize cockerel a grand shaped bird, but not quite pure in colour in under parts, and rather heavy hocks. Second not nearly equal to him, and the other birds poor.

13.—Both first and second-prize pullets good pairs, the first best in size, shape, and marking, but rather yellow. Had third been larger, we would as soon have had them as any.

14.—First-prize White Cochins a little hocked, but honestly shown, and we were glad to see them both so shown and so winning. Second well shaped and large, but the cock yellow. Two or three other fair pens highly commended with judgment, but the rest poor.

BRAMMAS.

15.—In the old Dark Brahmas the cup pen contained the first-prize Birmingham bird, whose only fault was some white in the tail, with a very middling hen. Second also had the second Birmingham cock, with a much better coloured but smaller hen in bad health. Had she been in condition it would have been hard judging. Third, a middling pen, the hen much wanting depth of colour. Pen 217, also a good pen.

16.—First-prize Dark cockerel a medium-sized bird, perfect in colour, but not standing well on his legs, and saddle rather too low. His head also struck us as coarse and heavy. Second-prize a decidedly hocked bird honestly shown, and quite as good as the first. Third, a very white-tailed bird, and full of white streaks in the buff. There were several very good highly-commended birds, but in one case (247), the commendation was a farce, the bird's hock having given way outwards, so that he could not bear his weight on one leg at all.

17.—First-prize pullets a very fine pair, third at Birmingham, and not yet at their best. Second-prize middling in colour, but very high on leg. Third, a very passable pen, one bird being really fine, and in our opinion should have been second.

18.—The cup pen of old Light Brahmas was a doubtful award. The hen was very good, but the cock had a great deal of black in his buff, and in a month will be hocked, the quills being half grown. His backle was, however, beautifully striped. Second, a good pen, but looked overdone. Third, a good pen, perhaps a little hocked, with not the slank feathering a hock should carry.

19.—The cup Light cockerel was a small but pretty bird, with long

wattles, very much the same style as the Birmingham winners. Second, a rather woody bird, cleaner, but not so good as pen 316 next door. Third-prize best striped of any in the class, but short of leg feathers. Pen 300 well deserved being added to the list of commendations.

20.—The cup pullets were very nearly perfect, whether in shape, feather, colour, or other points. Second very bare of leg-feathers; and third had faulty backles. Pens 335, 345, and 347 were all good pairs. Again the Lights showed much better than the Dark, and Light pullets were, perhaps, the best of all the Brahma classes.

SPANISH.

21.—The Spanish classes all looked much better than at Birmingham, the temperature and light appearing to suit them. Old cocks very fair and well placed. Pen 374 had a capital face, but comb gone half over. Hens also in very good order, the winner in the preceding class repeating his success with a very good pair. There were one or two pens in this class we could not understand being passed over.

22.—The cup Spanish cockerel had an immense face, but rather too coarse. Second-prize also a very wide face of better quality, and, on the whole, we preferred him to the other. The rest of the class we would not like to have the placing of. This and the pullets seemed to us the best classes in the show.

24.—The cup pullets were thought by many not deserving their honours. They were a good pair unquestionably, but either of Mr. Jones's second and third prize pairs were better in our opinion. All the birds were, however, so good that judging was hard. Miss Penman's pens came too late for competition.

FRENCH FOWLS.

25—28.—The classes for French fowls were very fair, many of the Birmingham birds competing. It appears certain now that the only varieties which can stand their ground in England are the Houdan and the Crève-Cœur.

HAMBURGHIS.

29, 30.—Golden-spangled Hamburgs were, as a class, hardly up to the mark, but the prize pens were very good. Silvers were decidedly a better class, the cup cock having a beautiful tail, which was a treat for any Hamburg fancier to see. The same may be said of pen 522.

31—33.—The Golden-pencilled were richer in marking than Silver. The light was too bad when we examined these classes to say much as to the judging, but we thought Mr. Beldon's pen 559 ought to have been in the prize list. The first-prize Blacks were a really magnificent pair, and second and third were very good, but we liked third best. This breed is advancing still year by year.

GAME.

34.—The cup Black Red Game cock had the best head and upper works generally of any in the class, and was a good specimen Game fowl. Second, a tight looking bird enough; third not quite so large, but, if anything, better style. 66 was a good bird spoilt by being too fat.

35.—First-prize hen was an only middling bird with bad carriage, the commended pen 648 being far better. Third-prize a neat gamey hen, but on the whole the second-prize was about the best in the class. Pen 637 contained also a very good hen.

36.—The first-prize Brown Red cock, a very hard bird, and well-shaped all but head, which was long and weak. Third much the same style of body, but better head. Second a middling bird. The best bird in this class (645), very unfortunately arrived too late for competition; he was almost a copy of the first-prize, but with the advantage of a perfect head, and must have headed the class but for the delay, which was owing to the railway company.

37.—The first-prize Brown Red hen was very good. Second-prize a good body, but far too red in the face. Third-prize too heavy; a little starving would improve her.

38.—Duckwings were a fair class, and all the prize birds were good. It was little more than a toss up between first and second.

39.—First-prize Duckwing hen a neat and sharp-looking bird, but on the whole we would rather have seen the second-prize in her place. Third-prize a rather large but otherwise good bird, not in her best condition. Many of the Game birds were severely trimmed.

POLISH.

40—42.—The Polish classes were fully equal to Birmingham, and again the Golden-spangled were both the most numerous and best of the lot. We were very glad to see this splendid variety again so strong in numbers and quality. The Blacks were rather poor.

MALAYS.

43.—Malays were a bare average for a separate class. Most of the birds had been at Birmingham, and appeared in rather low spirits.

ANY OTHER VARIETY.

44.—In the "Any other variety" class the first prize went to a fine pair of Black Cochins, the second to Negro Friesles (what ever will people breed mere abortions for?), and third to a very large pair of Cuckoo Cochins. The fourth prize was an error, not creditable to the discernment of the Judges, as it did not need any description in the catalogue to stamp them at once as a cross between Dorking and Dark Brahma. We much regretted not to see Mr. Tegetmeier's pen (729) of White Leghorns in place of this latter pen.

GAME BANTAMS.

45.—The cup Black Red Bantam cock was a beauty—the same

which won first in the pen at Birmingham, and with sincere satisfaction we chronicle the fact that he was shown *without* the new tail some would have put in, and that Mr. Smith gave him first prize as he was. Second a very neat been-looking bird; but third carried his wings very low, and struck us as more a Fantom than a Game bird. This class was middling, and far inferior to Birmingham.

46.—First-prize Black Red hens a really fine pair, but the second we did not like at all; the light was bad by this time, but they seemed to us very "stumpy" Beauties. Third-prize carried their wings far better.

47.—The cup Brown Red cock a Game bird, and second ditto. The third rather too heavy, perhaps, but otherwise good.

48.—First-prize hens in their place. The second we could hardly see, being in the darkest corner of the Palace, but they also seemed a pretty pen. Third fair, but we have known Mr. Crossland show far better.

49.—The first and second Duckwing cocks very good, but third much too fat.

50.—First prize in this class went to a good pair of Duckwings. The second far inferior. Third was a middling pair of Poles, to our liking not so good as another pair, but again the light was so bad we would hardly venture to quarrel with the award.

51.—In the Blacks, first was a first-class pen. The first-prize Birmingham winners were left out in the cold, and might certainly have displaced either of the others with advantage, if not the first.

52.—In this class the Judges acted on the principle, after awarding one prize, of giving the next to "Any other variety," the first going to a nice pen of Salmagundis, the second to Pheasants, third to a very middling pen of Japanese, and fourth to Whites.

SELLING CLASSES.

53-57.—The Selling classes were one of the most remarkable features of this Show, the three classes between them numbering only three less than two hundred pens! Many of the pens were of a quality that defied very good prices. In cocks, first prize went to a Bantam. In hens, the same breed carried off the honours, the second going to Partridge Cochins of very good value, and the third to a really good pair of Buffs. This last pen we thought should have been first, and had it been entered in the Buff class would have run the winners hard. In the "Husband and wife" class, variety was again studied, the first being Dorking, second White Cochins, third Sulphur, and fourth Black Red Game.

DUCKS, GEESE, TURKEYS, &c.

58-57.—We cannot give the weight of the Ducks or anything else, for the simple reason that no pens were weighed. The first Aylesburys were a good pair, but decidedly not so good as several others; neither did we much like the second. Third was very fair. In Bantams, the first was better placed, but Ducks are poultry that we think ought to be weighed.

58-59.—In Black Ducks the awards gave nothing to complain of, and all the prize pens were remarkably good. In the "Other variety" class, Mandarin and Carolinas were again conspicuous and good, and males being for a large garden that we might keep them ourselves.

60.—In the Goose class, both first and second were taken by Whites. We think had they been weighed, there was a pair of Greys would have taken at least one of these two places, but we cannot say.

61.—The first prize for Turkeys went to a pair priced at 5s. Mr. Patton's grand pen going third. Second was a good pair; but in this class again the scales were missed, probably as much by the Judges as by ourselves.

62.—The Pheasants were shown in exquisite order, and may be suggested to other shows as a most attractive feature, as far as the visitors are concerned.

63.—In the dead poultry class, Mr. Dowett's celebrated cross-bred were beaten by the Coloured Dorkings of Mr. Ellis. In Ducks, the first-named exhibitor carried off both prizes in a style which would make some hints on feeding from him most acceptable to all readers of this Journal.

As a whole the Show was a treat to inspect; but with the exception of Eight Brahmas, Spanish, and Polish, it seems to us that the birds of this season generally are not equal to those of former years. We noticed this at Birmingham, and we must confirm it now. In Cochins the falling-off is deplorable except in a very few cases both shape, size, and colour seem gone "all to pieces." Dorkings also, as a class, losing both frame and weight. Game are not so bad, a few breeders still keeping up the old standard; but the "ruck" are losing ground, getting both heavy in body and stilly in leg.

We have only to add, as will have been gathered from some of our remarks, that several excellent pens arrived too late to be noticed by the Judges. Some of the birds to our own knowledge arrived in London in time, so that the fault would appear to rest with the local line.

THE PIGEONS.

Few Pigeons were ever before exhibited in such numbers, such excellence, and under such favourable circumstances as I beheld them in the Crystal Palace this day (Tuesday). As to numbers, there were above 800 pens; as to excellence, the first fanciers in England, Scotland, and Ireland had sent their birds; and as to the position and surroundings of the Pigeons, I must ask those of my readers who know

the Crystal Palace—and I suppose those are almost all my readers—but who, unfortunately for themselves, were not present, to imagine the centre of the nave of the Palace devoted to the Pigeons, and to the Pigeons only (so far removed from the gentle Doves were the fowls, Geese, Ducks, Turkeys, &c.), 120 yards of the length of which were occupied by the pens, which were four wide. Thus, had there been but a single row, there would have been 450 yards of Pigeon pens. The majority of the cages were the Glasgow bell-shaped open-wired kind—excellent, save that each wants a sliding door for the safe handling of the birds, one of which, owing to this want, I saw escape. The rest of the cages, the square ones, had this accommodation of a door. And then, forming a very marked feature of the Show, were the large and elegant Peristeric pens, containing the collections of four pairs of birds. I must add that great care was taken of the Pigeons, and I saw members of the Committee themselves attending actively to the birds' wants. Taken altogether, the oldest fancier living had never seen such a show as was gathered beneath the central arch of the palace of glass, almost, indeed, making true the remark of an ardent fancier from the Emerald Isle, "There never was a show before." However, let us not forget former exhibitions, notably that of Glasgow in 1868.

But now for the classes. Of Pouters there were above 200 pens. This great cluster of these birds struck one forcibly at once, for in England Pouters had always before been few; but Scotland had invaded us, and an Irish Pouter (not a Fenian one), had come over; also we must remember the many articles which of late years have appeared on this noble bird. First came Blue-pied cocks. Mr. Fulton's bird, the first prize, was 7½ inches in limb, and 19½ in length. Mr. Gresham took second with a very fine showy bird. There were nineteen entries in this class. Among the eight Black-pied cocks Mr. Gresham's first was 7½ inches in limb and 20 inches in length, and flat and the other two winners were perfectly clean in thigh. The Red-pied were a mixed lot. Mr. Rose's (second-prize) I greatly admired. Yellow-pied were beautiful, and Mr. Montgomery secured two of the prizes. The White cocks, twenty-seven in number, were many of them very dirty, now a White Pouter loses half its beauty unless it is perfectly clean. The second-prize was a splendid bird. The "Any colour and marking" were true to those designations. "Mottley was their wear"—washed-out Yellows, Sandies, Mealies, Whites with a smatch of colour, Chequers, &c., but size and shape redeemed colour. Among the standard colours bred in 1870 three Blues won. The Blue-pied hen Pouters were not inferior to the cocks; the Black-pied scarcely equal. The Red-pied showed a first-prize very sound in colour; the second a fine bird, but with a white forehead. Yellow-pied, Whites, Any colour, and standards of 1870 followed.

The Black Carrier cocks were remarked on for their great excellence. The first-prize was a grand bird, showing strength and beauty combined. The first-prize hen was pretty, the second very strongly built. The Dun Carriers were fewer and not so good; the first-prize hen pleased me best. In Carriers, any colour, the prizes went to the Blues, the colour of which, to get the head good, showed much mixture with the Black birds. The Carriers bred in 1870 showed many birds of great promise.

The Almond Tumblers were, I believe, easily judged. The colour of the prize birds was extremely rich, and the first-prize among those bred in 1870 were excellent in head and beak.

The Baldheads, those birds so difficult to breed good, were but few, and save the prize birds, not good and a little large, yet there were some respectable in cut and feather.

Beards were more numerous, blue their prevailing colour, but the third prize went to fair Blacks.

Barbs—the is, old ones, were not numerous, but there were eighteen pens of those bred in 1870.

The Jacobins were very numerous, but they ran somewhat large; among them a singular and very striking looking pair entirely black—that is, head, flight, and tail black as the body. Unfortunately one was a very inferior Black, or I suppose the birds would have had a prize. Close to them was a nice pen of pure White, but not for competition.

The White Fantails were very good, but English judges still cling to tail rather than motion, for two pairs of Glasgow birds, small in size and superb in motion, were unnoticed. Blue Fantails of much excellence took a first prize.

Nuns were fewer than should have been, but the first-prize birds were super-excellent. It was gratifying to see two pens of Yellow Nuns.

The Black Trumpeters were admirable, and three pairs of the Irish brigade vanquished all opponents. It is well to remember that Trumpeters, any other colour, were not won by Mottles, as they, though grand in head and points, were too light for Mottles.

The English Owls were stronger in numbers than they have been recently, and it is well, for the Foreign Owls should not push the older favourites to the wall. Each variety has special attractions.

Turbits, Blue and Silver, were few. The Magpies were a little coarse in some specimens. Red, Yellow, and Black won in the order of the colours.

The Dragons were very numerous, and the other colours appear determined to overturn the Blue supremacy.

Tomars were large enough, and I had almost said ngly enough, to please their admirers, but the awards to this class and the Dragons had not been given when I left.

The Any other variety class, beautiful in feather and fanciful in

E. Horner; H. F. Noller; E. B. M. Boyd; J. Thompson; C. P. Fulton; T. C. Boyd; E. Schmitt.
ANY OTHER COLOURS (Any other colour).—1, W. E. Van Haasbergen; 2, E. F. M. Royd; 3, J. P. Tudor.
FANTAILS (White).—1, A. A. V. Meersch; 2 and 3, J. F. Loversidge; *hc*, W. Choyce.
FANTAILS (Any other colour).—1 and Cup, P. H. Jones; 2, H. Yardley; 3, W. Choyce; *hc*, H. Yorker.
FANS.—1 and 2, W. Banks; 3, J. Dowling; *hc*, W. E. Easton; 6, F. Williams.
TRUMPETERS (Black).—1, 2, and 3, J. Montgomery.
TRUMPETERS (Any other colour).—1, E. Hooper; 2 and 3, J. Montgomery.
CHEQUEERS (Blue).—*hc*, J. Montgomery; W. H. C. Odgers; J. Bull.
OWLS (Hulbush).—1, P. H. Jones; 2, J. Goodden; *pr*, S. J. Crawford; *hc*, S. A. V. Alice; Capt. H. Henton.
OWLS (Porten).—1 and Cup, P. H. Jones; 2, R. Hulton.
TEALERS (Blue and Silver).—1, G. H. Gregory; 2, P. H. Jones; 3, J. Dowling.
TEALERS (Any other colour).—1, Fickling; *jun*, A. A. V. Meersch; 3, P. H. Jones; *hc*, H. Yardley.
MAGPIES.—1, E. Horner (Gold); 2, H. Yardley (Yellow); 3, P. H. Jones (Black); *hc*, E. Horner.
DRAGONS (Blue or Silver).—Cup, 1 and 2, J. Holland; 3, W. R. Tegelmeier; *hc*, J. Holland.
DRAGONS (Any other colour).—Cup, 1, 2, and *hc*, S. C. Betty; 3, J. Watts (White).
ANY OTHER VARIETY (Short-faced).—1, J. W. Bradley; 2 and 3, H. R. Wright; *hc*, E. Horner; H. F. Wray; J. A. Colburn.
BUNTS.—1, Lady E. Buxby; 2, P. H. Jones; 3, S. A. Wyllie; *hc*, T. D. Gray; H. Yardley.
ANY OTHER VARIETY.—1, J. Wallace; 3, W. F. Tegelmeier (Ice Pigeons); 4, E. Horner; *hc*, Rev. A. G. Brooke (Mottled); W. B. Tegelmeier (Flour-bush); J. Wallace; P. H. Jones.
SELLING CLASS.—1 and 2, J. Ford (Almond Tumbler); 3, H. J. Dwelly (Swiss Tush); 4, J. Guthrie (Almond Tumbler); *hc*, H. Brown; T. Chavry (Blue Dragon); J. Ford (Dragon); J. A. Greenhall; H. Gellert; G. H. Gregory (White Foulback); Hon. Mrs. Paget; G. Hooper; W. B. Tegelmeier; S. A. Wyllie;—Thompson; C. W. Price; *jun*.
BEST COLLECTION OF FOUR PAIRS (Exclusive of Carriers, Pouters, and Tumblers).—Cup and 1, W. Banks; 2, P. H. Jones; 3, B. Fulton.
BEST COLLECTION OF FOUR PAIRS OF SIMILAR TUMBLERS (Distinct Varieties).—1, 2, and 3, J. Ford (pair Black Tumblers, pair Blue Tumblers, pair Red Tumblers, and pair Yellow Tumblers).
BEST PAIR OF SIX WINGED SINGLES.—1, J. J. Sparrow (Blue Chequer); 2, W. Lund (Red Chequer); 3, J. Crawford (Red Chequer); *hc*, G. Grinsell; G. Mathewson; C. L. Sutherland; T. Cook.
POULTRY.—*Poultry*: Mr. E. H. Witt, Mr. R. Tealy, and Mr. J. H. Smith. *Pigeons*: Mr. E. Esquillant, Mr. Jones Percival, and Mr. E. Corker.

THE PIGEONS AT THE BIRMINGHAM SHOW.

(Extracted from Notes by Members of the Birmingham Columbarian Society.)

We regret to see so great a falling-off in the entries, and it would have been more conspicuous but for the spirited entries in the Antwerp classes—a result due to the liberality of the Committee and the Birmingham Columbarian Society. The management was good, as evidenced by not a bird dying, and we know the majority of the birds went home in as good condition as they left it. We should like to see all the pens supplied with the tin water vessels, and think a little dry red sand mixed with that now used would keep the pens drier, and pleasanter to look at.

TUMBLERS.—The post of honour was, as usual, held by the *Almonds*, who were represented by eight entries of far more than average merit. The first-prize pair in colour were superb, the hen as rich as the cock. We have seen a finer beak and wattle than the cock carried, and cleaner, better than the hen's eye or lash. The second-prize pair were not so good a match as the first, the cock again rather coarse in beak and wattle. Of the third-prize birds the cock, like the first-prize hen, was blotchy in the eye.

In the class for *Balds* and *Beards* the first-prize pen were a pair of Blue Beards; good match and colour. The second-prize birds were a pair of Yellow Balds, a nice pair. The third-prize takers were Beards. Mr. Fulton was highly commended with a pair of Black Balds, that would have looked much better of a little oil. In the *Short-face* class the first were a pair of Black Mottles, that wanted a little less or more oil.

We were pleased to see a class for *Muffed Tumblers*, but greatly disappointed that it was so meanly supported, as we know the town has a number of fanciers of the Muffed birds, and we expected them to support the first class made for them, for if well supported it would be an attractive class. The first-prize birds were a pair of Red Rose-wings, and the second a pair of Black Mottles.

We were still more surprised that the class for *Glean-logs' Tumblers* was no better supported, a bird that nearly all understand and would take an interest in. We can only account for it by their having been so long neglected by show committees, and their owners now not being generally aware of the honour conferred upon them.

ANY OTHERS.—Since it was admitted into the competitive lists of public shows, this class of Pigeons has attained such popularity as to be regarded as an important auxiliary to Pigeon exhibitions. More especially is this the case at Birmingham, where they are bred in great numbers, and the Council of Bingley Hall Show agreed to the subdivision of the Antwerps into four classes—Silver Duns, Blue Duns, Red Chequers, and Blue Chequers.

The success of the experiment will be best shown by the number of entries, which amounted to sixty-one—viz., Silver Duns twenty-three, Blue thirteen, Red Chequers fourteen, Blue Chequers eleven. The classes were well represented by good birds, though there is room yet for great improvement, which we hope, by careful breeding, will soon be achieved. In several cases the awards were not in accordance with general opinion; we believe that in one or two instances higher qualities were thrown aside, simply on account of colours not matching

exactly; this was especially the case in *Silver Duns*, in which class every other point of excellence was sacrificed—as an instance, the best pair in the whole of the classes shown by Mr. Wright, which possessed all the required properties of standard birds. Mr. Yardley's best pair shared the same fate. It is strange, after the judgment of the Silver Dun class, to find that colour was disregarded altogether in the case of the *Blues*. The hen bird of the pair which gained the first prize was darker than its mate, and its head was flat—a thing unpardonable in a show bird. Why the cup was given to this pair we cannot conjecture, when we see a pair of birds in the *Red Chequer* class, though only gaining a second prize, vastly superior. The *Blue Chequers* were skilfully judged, as the most meritorious birds received the awards, and the whole deserved praise.

CARRIERS.—The highly commended *Black* cock bird of Mr. Siddons we think was far superior to either of the prizetakers. This class was not well judged. The prize Black hens had been artistically trimmed; they ought to have been disqualified. The best Black hen (No. 2151) was passed over, though good in all points and honestly shown. All the specimens were sadly deficient in colour, the Carriers, as a rule, being inferior to what have been seen in Bingley Hall for some years.

POUTERS.—The *Red* cocks were a very inferior class, with only six entries. The hens were also a poor class of five entries only. The Pouters had ten classes apportioned to them, and £30 prize money for seventy-two entries. Unless fanciers help the committee they must expect these classes cut down. When the Whites were taken out and the first-prize birds in the other classes, a more meagre lot never appeared at any show.

REDS.—Only five entries to compete for £3 prize money and a silver cup, value £5, generously given by Mr. Green, which was won by Mr. Yardley with birds weighing 1 lbs. 6 ozs., Mr. Jones being second. Feather in this variety ought to be taken into consideration, so as to make it attractive, as well as mere weight. The winning birds were ill matched; such will always be the case as long as the scales have to decide.

JACOONS.—In *Red or Yellow* Mr. Fulton was first with a pair of Yellows bad in colour; the cock very coarse in every point. The hen's hood was completely broken—scarcely a feather left in the hood. The same gentleman was second with a pair of Reds—coarse; the cock foul-flighted and very long in feather, anything but good birds. Both these pairs of birds had been well greased either by accident or design.

In the class for *Any other colour*, of Mr. Van Haasbergen's pair of Blacks the hen was good; the cock was very coarse, open-frilled, no hood, and cut very low the same as a Bald. Mr. Royd's should have been second with pen 2294, a good pair of Blacks well matched. Mr. Percival also showed a good pair of Whites, with pearl eyes, in splendid condition, and fully deserving a high commendation.

FANTAILS.—In *Whites* Mr. Choyce was second with a pair of birds of good carriage, the tails having the centre feathers broken, which permitted their head to project through them. This was a good class, numbering twenty pens.

TRUMPETERS.—In *Mottled* Mr. Horner obtained both prizes. The first prize pair had good caps, rose, and muffs, with no mottle on the wing; had it not been for a few spangles on the head they would have had to compete in the "Any other colour" class. So long as this class is for "Mottled" birds ought to be mottled, or be disqualified. The second-prize pair were good, with the exception of white feathers in their flights. Mr. Erth's highly commended pair was decidedly the best in the class, though deficient in colour.

OWLS, ENGLISH.—Mr. Page was first with a very good pair of Whites, the same birds that obtained this position last year. Mr. Careless was second with a pair of Silvers, the best birds in this class. Had the owner done a little "weeding" he would have obtained the first prize, there being a small white feather on the face not larger than a pin's head. The Judges themselves acknowledged had this been drawn the position of the birds would have been reversed—encouraging this, for an honest exhibitor.

BUNTS.—At a future show it will be admissible to class Black and Dun together, so as to give the Yellows and Reds a chance, as the Duns are nearer perfection than either Yellow or Red.

BLUE DRAGONS.—The whole class was highly commended by the Judges. With this we cannot agree, as many of the birds were coarse, far too coarse to be admitted as Dragons.

ANY OTHER NEW OR DISTINCT VARIETY.—Mr. Banks was first with a pair of birds recently imported into England by the Secretary of the Birmingham Columbarian Society. They are dark-headed, tufted, and well frilled, very short in bill and head; every feather is spangled on their body; each flight feather has a spot of white on the end about the size of a sixpence; dark tails, with spots on each feather the size of a shilling, and grouse-muffed. These well deserved the award. The Rev. A. G. Brooke was equal first with a pair of Norwegians; Mr. Ailsop second with a pair of Damascenes, imported at the same time as Mr. Banks's. These were a good and well-matched pair of birds, of a light powdered blue colour, with distinct black bars, short in bill, and round-headed, the lash round the eye of a deep blue colour. Mr. Paget was equal second with a pair of Scandaroons, a variety of bird that possesses no particular merit, being large and coarse. Mr. Paget also obtained both third prizes with a good pair of Satinettes and a pair of Blunettes. These are good, and deserve a higher place. They are a blue-sided bird with a pink bar, every feather of which is edged with black, a blue tail with spots the same

as in the *Satinette*, the remainder of the body white; a good frill, and grouse-muffed. If this bird could be bred as short in bill and as round in head as the *Satinette*, nothing could surpass it. Swifts were highly commended. Mr. Watts and Mr. Banks also showed birds that were worthy of a prize, and were supported with the aforementioned varieties; they were good in feather and pencilling, and will be heard of at a future day. This was a remarkably good and strong class, numbering twenty-three pens.

BRECON SHOW.

Will you allow me to ask through your columns if any of the prizes awarded at the Brecon Show, on September 21st and 22nd, have been paid? I have not received the sum to which I am entitled, and on writing to the Secretary got no reply.—A CONSTANT READER.

[Give the Secretary notice that if payment be not made by a day you name, you will sue him in the County Court.—Eos.]

BALDHEADS AND BEARDS.

I THINK it is high time my cooing should be heard, for I consider I am a neglected bird, and have quite as much right to be seen and admired at shows as other Saut-faced Tumblers. Nine out of ten prize lists do not contain a class for me. I think the number of entries at the Palace Show affords a clear proof that a separate class for Baldheads and Beards will pay.—AN OLD BEARD.

FOUL BROOD.

ABOUT this time last year I sent you an account of the successful introduction of six Ligurian queens into as many stocks of black bees (in Ireland), and looked forward to being able to report a favourable return for the trouble this season. So far from this, however, if I would "a tale unfold," it must be one of unmitigated disaster; and as the misfortune of our neighbours will generally convey a lesson, if rightly viewed, I am induced to send you the following account of my apianian troubles.

It may be, and I think probably is, the case, that some of your bee-keeping readers are in the same unconscious state of blissful ignorance in which I have been in; and whilst reading plenty about the horribly infectious foul brood, and even seeing their stocks dying unaccountably before their eyes, never for an instant suspect that they have the contagion in full force in their own apiary. As my experience may put such as these on their guard, and lead them to a careful examination of their stocks, or may somewhat interest your more fortunate bee-keeping readers, you may, perhaps, think it worth a place in your columns.

At the fall of the season of 1869 my apiary boasted of ten stocks—viz., the six black ones with Italian queens (mentioned above), two pure Ligurian stocks, and two hives of black bees, with queens of the same colour. All were strong with good stores of honey, and although, when examining the six stocks to find the black queens, I saw through all patches of dead brood, these did not attract any special attention. I made all up snug for the winter, well satisfied as to the state of my colonies, and with bright anticipations of a fine return from the next honey season.

March of the present year was fine and mild, and the bees began to show outside early; the black stocks in the smallest numbers, the pure Italians much stronger, and the Ligurianised ones sending out a goodly number, among which a large proportion were well marked Italians. By the middle of April a complete examination was thought advisable, resulting, much to my disgust, in the discovery that the two black stocks were dead, not a bee being found alive in them, but there were large stores of honey; most of the other hives were very weak, while a few were tolerably strong, but none in the condition that their strength in the fall and the so far favourable season would have led one to anticipate. At last the dark suspicion forced itself on my mind, that for two seasons I had been nursing the dreaded foul brood, and by every possible means spreading it through my apiary. A piece of brood comb sent to Mr. Woodbury elicited an opinion that but too strongly confirmed my worst fears, which all the valuable information in your Journal had before failed to arouse. Many things before so mysterious were made at once clear, and the cause of the devastating influences which had in 1868 reduced the number of stocks from eighteen to ten, and again in 1869 still further reduced the toll, was apparent.

However, I resolved on trying Dr. Preuss's system of cure,

and having laid in a stock of new hives, frames, and bottom-boards, with a supply of carbolic acid and lime, I set to work to try to get rid of the plague off-hand. Every colony was diseased, so going through them all I changed the hives (soaking them, as taken away, with carbolic acid), cutting out all the diseased brood I could find, washing each frame with carbolic acid, and laying down lime in front of the stands. In ten days I had to repeat these operations, the stocks being as bad as if I had done nothing, and at this time I also found two of the hives queenless, and so weak that I had to join them to two others in order to save the remaining bees. Ten days later being in no better condition, and finding the season slipping over without any result being obtained, I decided to resort to the more vigorous measures recommended by Mr. Woodbury; and fresh hives, &c., being again procured, I brushed all the bees into them, and left them to begin the world again.*

An inspection in another fortnight showed me that once more the plague was doing its work, and two more of the stocks were queenless. This left me but four stocks, as the last two I also added to others.

Finding now the powerful enemy I had to contend against, I gave up almost all hope of saving any of my stocks, and turned my thoughts to the preservation of the Ligurian queens. Two black stocks were therefore purchased in old-fashioned straw hives, and placed in position about two miles from my original apiary, and having driven them I fixed the combs in frame hives, and transferred the bees into them. A few days afterwards I took the black queens out of these hives, and introduced the Ligurian queens from two of my original, and now diseased stocks, leaving them to raise new queens, which they soon did. By constant examination, and cutting out every foul cell as it appeared, I was able to strengthen the four infected colonies, but not to get rid of the disease. At the end of September I obtained two more stocks in straw hives, and doing the same as before with the combs and bees, I exchanged their queens for the two raised in the Ligurian hives.

I was now in possession of four Ligurian stocks in good health, and four diseased ones; of these I have since moved two to another part of the country, and having purchased a quantity of honey in the comb, have fitted up new frame hives with it, and transferred the bees into the hives so furnished. The one longest done is now working well as far as the weather permits, and when last examined seemed free from disease.

The other is only recently done, so I cannot say how it will turn out, but if it succeed we purpose doing the same with the remaining two infected hives, and so leaving the original apianian site without a stock, so to continue for some time. This is, I believe, the next best thing to burning the diseased stocks and all belonging to them in the first instance, which is, after all, I am convinced, the cheapest thing to do wherever this disease gains any way in an apiary. Had we done so when we became aware of its existence in our stocks, we should have been saved an immensity of care and anxiety, and would be now fully as well off as we are.

I think you will admit that few apianians would take anything like the same trouble that I have done (nor indeed would I advise them to do so, when the disease has obtained full possession of most of the stocks, as in my case), yet you see that all the results I have to show are two stocks saved (if saved at all) at the very end of the season, and at the expense of an entire new outfit and fresh combs of honey.—HIBERNIAN BEE.

* You appear to have omitted the three or four days "penal discipline and banishment," in an infested hive, which is a most essential feature in the only mode of treatment which I found at all efficacious in curing foul brood.—A DEVONSHIRE BEE-KEEPER.

OUR LETTER BOX.

FOWLS DYING.—FEEDING (E. P.).—The purple comb, loss of appetite, moping, and then dying, indicate poison, and I write thirty die off we should be disposed to attribute the destruction to that cause. Your feeding is very bad; it is good enough to keep your fowls alive, but not in good condition. The only good food you give is the crushed barley, and you qualify that with bran. Give at daybreak a feed of half-peas or of ground oats slaked. Give table and house scraps and whole corn at mid-day, and again in the evening. Eaten potatoes, Indian corn, and bran. If you have another foul attack I give immediately three pills of camphor each the size of a pea, and about a table-spoonful of brandy and water, half and half. We have known this very successful in restoring a condition, and shall be glad to hear the result in your case.

HENS GOING TO THE NEST, BUT NO EGGS (Eggs).—There is mis-

management somewhere. We believe your fowls laid and ate their eggs. The Brahmas are not only good layers, but they are useful fowls in every way. Fourths flour and bran, and Indian meal, are all bad food. Feed as we have advised "E. P." above. Watch your fowls, or let them be watched when they go to nest, and do not give them the opportunity of eating the eggs they have laid. If they continue to lay soft eggs it is because their secretions are at fault, and we attribute it principally to their food. We have no doubt more attention to that point will remove all cause for complaint.

COCHIN-CHINAS (I. B.).—Your first case is not a disqualification, but it is a disadvantage. In the second case we should send the finer bird.

DARK COLOURED DORKINGS (M. B. D.).—There is so much difficulty in breeding the Silver-Grey Dorkings, that we advise you to adopt the "Dark Dorking." You will occasionally breed Silver-Greys from Dark, and Dark from Silver-Greys. From the mixture of colour you mention you will breed handsome birds partaking of the feather of both parents, but the probability is you will not breed either pure. You will not injure your dark birds by mixing them with light, but you would spoil your light by mixing with dark. As you say your fowls are for family uses, we advise you to breed perfectly pure Dorkings without troubling yourself about colour. The only work entirely devoted to Dorkings was one published some years ago by Baily, and called "The Dorking Fowl." It is now only to be had bound up with the rest of his work on poultry.

CHICKENS NOT TRUE IN COLOUR (E. D.).—You must choose your Brahma breeders next year without a suspicion of brown. The chestnut patch on the wing of the cock is often seen, but it is not desirable. We do not think the Light Brahmas breed more truly than the Dark. Both are subject to the difficulties and disappointments that belong to all breeding to feather. The best of every breed are the sexerest and the most difficult to breed. Your buff shade is a disappointment to you, and a disadvantage at a show. It is not a disqualification.

RUÉ AS A MEDICINE (Barkhamstead).—Rué is a very old-fashioned poultry medicine. It is given chopped fine and mixed with butter. Embryo eggs can always be found in a hen from the time she begins to lay till she is past it. When in full laying they are more developed, and show the order in which they will be laid.

EXPERTISE BRAHMAS (Worcester).—It is not usual to wash the feathers on the legs of a Brahma cock, but there is no difficulty in doing it. Take some warm water, and for white feathers some soap, rub the dirty feathers with a piece of flannel and dry before a fire or in a basket of clean soft straw. As only the outer and exposed part of the feather is dirty, you must be careful to see only that part, and the cleansing must be done by wiping the feather down. If this plucking be hurried and wetted you will have done harm rather than good. If the Brahma price was justified at a small show, either the bird had lost condition or the judges were at fault.

BRAHMAS (H. C.).—Your Dark Brahma weighs well (9) lbs. at seven months old, and may be exhibited with good hope of success. Your Light Brahma with a single comb is worthless to breed from, as he would be sure to disappoint you. So far from breeding from a party-feathered cock to improve any black breed, the difficulty is to breed cocks without foul feathers. Buy a cock and two or three hens of the best you can get, and cross them with your own. A Spanish bird often helps, but it requires a good deal of comb-comb line-bone-out.

BLACK BIRD GAME FOWLS (Sub-criber, Teol-in).—Wherever all the points of a breed are required, we, with all good feeling, advise our readers to buy one of the many books published on the subject. Our hints will not permit us to repeat. One essential in a Black Red Game cock is a thoroughly black bill and feet, any white is a defect. The hens should be brown all over; they may have wheaten breasts, and must have yellow striped hackles. All preceding in and in is in our opinion injurious. We prefer breeding from hens with young cocks to young hens or pullets with an older mate. The Cambridge Turkey should be spangled all over. The cocks may be kept three seasons, and one bird will be enough for twenty, thirty, or more hens. It is usual to run three Geese with a gander. Build n Geese are average breeders, but not so prolific as the Toulouse.

FEEDING TO INCREASE WEIGHT (G. M.).—Your food is not good enough for hens to attain up weight at this season of the year. In your morning feed put in parings and soil of the road. In your afternoon feed you will get more that will do well on bread and barley-mixed. Bran is absorbed by fowls. They do not assimilate, they are obliged to swallow it whole; if they do and imbibe flesh, and they drink too much, they will have the kitchen scraps and the Potato parings and the rice. Let them have them in a shed with hay-mat. At midday give them whole barley and in the afternoon dry. In the evening feed as in the morning. If there be not enough of the kitchen scraps to make two or three meals, divide the quantity equally. It is of no use to give oats to fowls. Ground oats are the best food, and barley-mat the next best.

BRAHMA COCKS REELING IN HIS FEATHERS (T. A. D.).—Your bird is heated, but if all your birds are heated alike, and thus only loses its feathers, it cannot be the result of their food. The skin is so heated that the feathers are not fed, and the root itches; this causes the bird to pull them out. The cure is to purge freely with castor oil—a table-spoonful every day, to give lettuce freely, and to follow up with Baily's pills. If you must catch the bird, and keep him quiet, till he be cured, and it will not be long.

POULTRY FEEDER (I. T. G.).—The feeder you mention is called a "hopper." The bird jumps on to a table, which, falling with the weight of the bird, opens the box that contains the food. It is made by Baily and Son, Mount Street, and is very durable and inexpensive. We do not think such feeders good for poultry, as the exact theory is that fowls should not eat more than what at a time, but pick it up grain by grain, with blades of grass, chopped weeds, small stones, and many other things good for health, and necessary for digestion. The plan we adopt is to give in the corn, which is too large for small birds. We have many, but not enough for a mouse, till the bird weathers it in.

PULLETS AND CARRIERS (Sub-criber).—If you only need eggs, the carrier need not be kept.

CARRIER'S HEAD (G. G.).—The head of a prize Carrier Pigeon must be long, narrow, and flat, the top having a slight depression in the centre. Length, narrowness, and flatness, are the great points in the head; if it be round, it is called barrel-headed, which is a great fault. Length of

skull and beak should be, in a cock, 2½ inches, in a hen 2 inches. The width of the skull should not exceed half an inch, measured at the back of the head behind the eye-wattle.

DRESSING RABBIT SKINS.—Wellwisher has sent us the following in answer to a query from another correspondent—"Rabbits' skins may be cured so as to remain soft and pliable, by the following method:—Soak them for a short time in water, and then, if they require it, trim them on the inside by scraping. Then place them for three or four days in a bath made by mixing 2 lbs. of bran in a gallon of water. Next a paste made with 1 lb. of alum, and 3 ozs. of common salt, moistened with water and worked together, is spread on the inside of the skin and left for about eighteen hours. Then hang up the skins to dry, with the fleece or hair outermost, and, if possible, in the sun. After this smooth the inside with pumice-stone, then stretch or brush the outside."

CENTRIFUGAL HONEY-EXTRACTING MACHINE.—"Have any of your readers tried the above-named machine? If so, with what result? Is it easy to make from the directions given in 'our Journal?' and is it efficient?"—J. R. J.

PERRY.—"I. B." wishes to know how to manage perry so that it will be sparkling in the bottle.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending December 6th.

Table with columns: DATE, BAROMETER (Max, Min), THERMOMETER (Air: Max, Min; Earth: 1 ft, 2 ft), Wind, Rain. Rows include Wed., Thurs., Fri., Sat., Sun., Mon., Tues., and Mean.

- 31.—Clear and fine; densely overcast; cloudy and cold.
1.—Fine and frosty; overcast; cold wind, overcast.
2.—Densely overcast; overcast; fine, frosty air.
3.—Sharp frost; overcast, slight rain; densely overcast.
4.—Clear and frosty; cloudy and cold; fine, frosty.
5.—Sharp frost; densely overcast; overcast.
6.—Drizzling rain; rain; heavy rain.

COVENT GARDEN MARKET.—DECEMBER 7.

The markets generally are supplied in excess of the demand, and many stands remain uncleared at lower prices, any improvement upon which must not be expected for a week or two. The first season afforded an abundant crop, and the imports of fruit continue heavy, and good prices can only be obtained for choice parcels. The Potato trade is somewhat better, choice Regents bringing 70s. to 8's. per ton.

FRUIT.

Table listing various fruits and their prices, including Apples, Cherries, Chestnuts, Currants, Blackberries, Raspberries, Strawberries, and Walnuts.

VEGETABLES.

Table listing various vegetables and their prices, including Asparagus, Beans, Broad, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endives, Kidney, Lettuce, Mushrooms, Onions, Parsnips, Peas, Potatoes, Radishes, Rhubarb, Spinach, Tomatoes, Turnips, and Vegetable Marrows.

POULTRY MARKET.—DECEMBER 7.

The cold weather and the approach of Christmas have somewhat improved the tone of the market in all but Game.

Table listing various poultry and their prices, including Linnets, Small ditto, Cuckoos, Ducks, Hens, Pheasants, Pigeons, Rabbits, Wild ditto, Hares, Partridges, and Grouse.

WEEKLY CALENDAR.

From observations taken near London during the last forty-three years, the average day temperature of the week is 55.4°, and its night temperature 33.7°. The greatest heat was 59°, on the 15th, 1868; and the lowest, cold 7°, on the 16th, 1853. The greatest fall of rain was 0.87 inch.

THE EVERGREEN OAK.

SINCE the rage for Pinuses has set in with so much ardour, it is to be feared that many of our choice evergreens have been neglected, and orders sent to nurserymen for Phillyreas, Alaternus, Arbutus, and the like are so limited that it is not unlikely some of these trees and shrubs will by-and-by be regarded as rare. There is also another tree deserving to be more frequently planted than it is, and that is the Evergreen Oak; for although old gar-

dens and grounds present us with many fine examples of this tree, it is seldom met with in a young state. It seems to have somehow lost favour with the working gardener, for it sheds its leaves at a time when the garden is expected to put on its best garb, and a tree of this kind on the lawn causes a continual sweeping-up of leaves for about two months of the busiest part of summer. Another cause of disfavour is the small number of subjects that promise to become well-shaped trees, most of them taking the shrub or bush form. The latter evil is a difficult one to prevent, for it occurs in plants raised from seed as well as in those from cuttings and layers. To these drawbacks another important one may be added—the Evergreen Oak transplants badly, being in this respect, perhaps, the very worst tree we have to deal with. These united evils no doubt exercise their influence on planters, and lessen the number of trees planted. On the other hand, the fine examples occasionally met with excite a feeling of another kind, and the wish is expressed to have as fine a specimen as that which has been seen.

In reference, therefore, to the planting of this tree, I believe the most successful results have been accomplished by planting in May, and even at the end of that month, but I only give this advice on the authority of a friend, as I have not personally transplanted at that time. Young trees are also recommended. If the weather is dry and bright, some shading is desirable for a few days, and a shower of rain will work wonders: by the end of summer the tree will have assumed its proper costume, and all will go on well. If I had a plantation of this tree to make in the autumn, I would be disposed to adopt the most primitive mode of all, and that would be to put in the acorn where the tree was to grow, and if the soil and subsoil were all right, I would leave the rest in a great measure to Nature.

I must here state what I have already said in other places—that I am no enemy to tap roots of any kind, excepting as regards some fruit trees, and I am not sure they are injurious to the latter: but with respect to all deciduous forest trees, Pinuses, shrubs, and the like, I have first to learn the harm such roots do ere I condemn them. On the other hand, there can be no question of their utility, or Nature would not furnish them: they give the tree a sort of anchorage in the ground, so necessary for resisting the winds, and we may rest pretty well assured that tap roots are only formed on such trees as want them. We must consequently act directly at variance with

Nature's laws if we remove roots so necessary to the tree or shrub: therefore, by sowing the seed where the plant has to grow, every facility is given to its roots extending in any direction which may be most beneficial. I have a shrewd guess that in half a dozen years a plant so reared will be larger than one transplanted at the same time as the seed was sown, providing fair treatment be accorded in both cases, and the healthy vigorous appearance of the young seedling would be much in its favour: and possibly some interest might attach to it by some juvenile member of the family putting the seed in the ground, and in after life being able to point out a large fine tree that he remembered sowing. The Evergreen Oak affords as good a memento as anything, and from the appearance of old specimens, seems likely to retain its vitality for a much longer period than many Pinuses.

Having in some degree described the mode by which ill success in planting may be easily prevented, for seed is plentiful enough, I will next take in hand the more difficult problem of inducing shrub looking plants to become trees. Here, it must be confessed, a great departure from Nature must be made, and the knife and stake put in requisition, but they may be used with better hopes of success on this tree than on many others, for I do not know of anything deciduous or evergreen that bears a severe pruning with less injury than the Evergreen Oak: even trees of large size may be half-cut away without injury when it is necessary to improve their shape, and they speedily feather out and recover a furnished appearance on the side which has been cut. Trees of 30 feet high, or more, and provided with three or four leaders, may have them reduced to one with a good prospect of that doing well; and whatever beauty there may be in a fine spreading head, there is more when that head emanates from a bole of some length. In all cases, therefore, I would advise a certain amount of clear stem if it can be had, and in most instances this can be secured by timely and judicious pruning: or should this happen to have been neglected till late, even then, as stated above, the tree, if healthy, will endure it with less injury than most others of a like kind.

Fine specimens of Evergreen Oaks are often met with. Witness the fine trees about Fulham. One in the nursery of the Messrs. Osborn, where there are also several remarkable trees, is very fine, as are also some others in the same neighbourhood: while one of the finest I ever saw was in the grounds of Yotes Court, the seat of Lord Torrington, in Kent. This tree, however, scarcely showed any stem, but had a fine spreading head of upwards of 80 feet in diameter, exhibiting foliage of the deepest green. Differing from this in everything excepting vigorous health was one I met with not many days ago in the grounds at Barham Court, a fine old place, where there are other remarkable trees, including many of recent introduction, the present proprietor, R. Leigh, Esq., having directed much attention to them. The Oak referred to is more upright than usual, there being a clear bole of 10 or 12 feet without a branch, and the girth of this bole at about 5 feet from the ground, where the stem is as smooth

almost as a ship-mast, is 10 feet. The height I could not ascertain, but it equalled that of some neighbouring Limes and other trees, and, standing in front of them, the fine green foliage offered a strong contrast to the autumn tints these trees had assumed.

While on this subject I may mention that at the same place, Mr. Ewing, the able gardener, pointed out to me a Willow-leaved Oak of the deciduous kind that seemed to be growing as quickly as the common one generally does. I did not ascertain how long it had been planted, but its fine straight stem surmounted by a vigorous head, having a sort of elliptical outline, indicated that at a period not long distant it would be a fine tree. As it was, the girth of the bole at about 5 feet from the ground was 5 feet 8 inches—a good size for a tree that, I believe, has not been so very long known to cultivators. The soil, I may add, was good, overlying the Kentish rag and its accompaniments—a soil in general favourable to the growth of trees of most kinds, and shrubs also, the Rhododendron and its congeners alone excepted.—J. Robson.

GOOD AND BAD STOKING.

It is curious, but none the less true, that the influence of the stoker on the economy of fuel is systematically neglected by engineers. In estimating the relative merits of different engines, it is always assumed that the fuel is burned under conditions with which the men who supply coal to the furnaces have nothing whatever to do—in short, that any man who can throw coals on a fire and keep his bars clean must be as good as any other man who can do, apparently, the same thing, and, apparently, nothing more. But it is certain that this conclusion is totally erroneous. The steam engine has been so far improved that it is only by the utmost refinement of skill that small economies can be effected in the consumption of fuel; and the brains of the best men of the day are taxed to the utmost to design these refinements, and apply them properly to their intended purpose. But all the while the influence of the skill of the stoker is overlooked, and, at the same time that we are moving heaven and earth to save an ounce of coal per horse per hour, we employ men without question who may waste through ignorance ten times as much fuel as we try to save, or neglect men who might save ten times as much by their skill as the engineer can hope to save by his. This matter was never brought into a clear light until the recent engine trials at Oxford, when for the first time the judges measured the water evaporated. The results were startling in the extreme. Frederick Moody, one of the best firemen in England, succeeded in obtaining an evaporation of 1.87 lbs. of water per pound of coal from the society's boiler, the Reading Ironworks Company's engine running for three hours nineteen minutes. Messrs. Marshall's man got from the same boiler, and with the same coal, an evaporation of only 8 lbs. of water per pound of coal. Messrs. Marshall's engine ran but two hours forty-four minutes, and consumed 5.18 lbs. of coal per horse per hour. If Moody had fired for Messrs. Marshall with as much skill as he fired for the Reading Iron Company, the consumption of fuel would have been but 1.22 lbs. We thus find that a difference in the skill of two stokers, both very good—Messrs. Marshall's man was far above the average of stokers—may cause a difference of nearly a pound of coal per horse per hour in the relative consumption of two very good engines. Surely it is time to think of the stoker when we find that he can save or waste 20 per cent. of the whole weight of fuel required to do a given amount of work. We have gone on improving boilers and engines for years—suppose that, just for a change, we try to improve the stoker.

In conclusion, we may point out that the anomalous results obtained from boilers of the same type under different circumstances are probably due to varying skill on the part of the stokers. No trial can in future be considered satisfactory which does not take this consideration into account.—(*Engineer.*)

We fear that if the word gardener were substituted for engineer it would be easy to find more fault with the mode in which gardening stoking of furnaces is too generally conducted. Even the most simple considerations are frequently neglected, and what ought to be a matter of thought becomes too often a mere matter of course.

The following precautions will never be neglected by a good furnace man. Before a fire is put on or mended for a hot-house the sky will be scanned, so as to form an idea whether the air is likely to remain as it is, or to become warmer or colder. The wind of the day is then to be consulted, and

note taken as to whether the mercury is rising or falling. The inside thermometer should next be examined, and its rise or fall noted; and then where a fire has been burning the heating medium, be it stove, flue, or hot-water pipe, should be felt by the bare hand, so as to be sure of the heat there, and thence, from practice, the stoker forms an idea of how that heat is likely to influence the confined air in the house. All these little matters will be attended to, as a mere necessity, by every good fireman before he goes to the furnace. Are they attended to as they ought to be? Is it not too common for a man to jump down into the stokehole and pile on the fuel? And if these little matters are attended to at all, it is after the fire is all right and blazing away with a vengeance, and sending the greater part of the heat, in the case of a boiler, up the chimney. Need we wonder that houses become too cold at night, or too warm in a morning, or the contrary? that when there is too much heat the furnace doors are left open, with the attendant waste? that dampers might as well be a thing unknown for the use that is made of them? or that in a cold morning fuel is piled on quite regardless of the fact that the keen air is accompanied with a clear sky, and in a few hours there will be such a meeting of sun heat and fire heat as to try severely everything at all tender, and where the very free admission of cold air will act almost as prejudicially as the extra dry heat? A very small fire in a cold morning, or no fire at all when the sun may be expected to act in a couple of hours, would often be much better than putting on much fuel; at least all the above little matters should be noted before doing so.

Much economy may also be effected by so managing the fire that the brightest part is always farthest from the furnace door, so that the smoke and steam may be burned by passing over the live coal. The more these matters are insisted on the greater will be the economy in heating.

In this respect there is no comparison, as to the fact and observation required from the best stoker to a steam engine, and the best stoker to the furnace of a tropical or forcing house, or a house where frost is merely excluded. The first has chiefly to husband the heat from the fuel as to get the greatest amount of steam from the water. The gardening stoker, if he would excel, has not only to study and practise how to get the most heat, but he has to study all the attendant circumstances of atmospheric changes, as too much heat in his case is often more dangerous than too little heat. Except where the frost is allowed to enter, we have no hesitation in saying that more harm is done by overheating at times than by frequent underheating.

Where much furnace work has to be attended to, a good thoughtful stoker will be one of the most valuable men about a place. The fuel he saves by consideration will tell largely in an economical point of view. So much have we felt this, that without calling in question the wonders that the boilers advertised in our columns are to accomplish with such an economy of fuel—and no doubt the inventors and patentees honestly believe all that is said of any particular boiler—we have little doubt that such a stoker would make one, or other, or each of them, the most wonderful for doing so much with so little fuel. How is it, then, that stoking the furnaces in a garden has frequently received so little attention? First, because the matter has not been deemed sufficiently important; second, because good stoking has not been sufficiently appreciated; and thirdly, because many proprietors of gardens, from some short-sighted considerations, make economical firing impossible. We do not so much allude to such a case as that referred to the other week, where a gentleman would prefer the joints of his pipes to be injured rather than insert an air-pipe, and care nothing about the heat round a boiler getting freely up the chimney, provided the damper was always drawn out; we allude more particularly to those gardens where, though there are several glass houses, no one lives near them to attend to them; and to keep them safe large fires must be put on before the men leave, and these must act whatever the change of the weather. In such a case economy in fuel is out of the question.—F.]

PASSIFLORA QUADRANGULARIS AS A CONSERVATORY CLIMBER.

THERE is a growing inclination among gardeners to plant some of the hardier kinds of stove climbers as permanent decorative plants in the conservatory, and one of their first favourites is the above-named Passion-flower. I do not object to their choice, for, as far as the building goes, I consider a

offly and otherwise roomy conservatory one of the best places in which to show off and to enjoy the beauty of this noble and grand flower; but then I find from experience that even if ample space be allotted to it, it is not in every conservatory that it will thrive; and when it does not succeed I think it is the most unsightly of plants for such places. Besides, it is almost certain to be doing badly when all other plants are thriving. On the other hand, with favourable conditions and treatment, it will succeed admirably as a conservatory plant.

I would say to those who are about to plant *Passiflora quadrangularis*, Well consider your plans before doing so, for the term conservatory gives a wide range of temperature—from that of a cool greenhouse up to that of the stove. Some employers like these structures kept at one heat and some at another, and I would not advise anyone to plant this Passion-flower where the temperature is likely to be for any length of time below 55°; for although it will flower in a comparatively low temperature, it is a stove plant, and requires a certain degree of warmth quite equal to the above, even when at rest, and when growing it will be better of a considerably higher temperature. I have grown the plant for conservatory ornamentation, and with 50° of heat it may thrive for a season or two, according to the severity of the winter, &c., but it has afterwards failed to maintain a healthy appearance, and to get the wood well ripened off in winter was impossible; the foliage, likewise, was sickly-looking; consequently in the following spring the plant was too weak to afford much bloom, and gradually became weakened in constitution, total failure being the result.

Nevertheless, if the temperature is not lower than that above stated, and a higher one can be given at favourable times in the year, I should not hesitate to give this *Passiflora* a prominent position in the conservatory. I have found the plant succeed well in a rich and moderately-heavy turfy loam two-thirds, and one-third sandy fibrous peat. I am not sure that this is the best compost to grow it in, but I know of none than one or two places where this Passion-flower is growing well in a similar soil. A very successful cultivator of this plant for conservatory decoration is Mr. Stalker, the able gardener at Hemsted Park, Staplehurst, Kent. I have several times visited that place within the last two years, and I have always found this beautiful plant in flower more or less, and I believe Mr. Stalker has told me that he grows it in a similar soil to the above; and he gives an abundance of tepid manure water when the plant is growing freely, and it flowers with him as late in the year as the present time.—THOMAS REARD, *Hatfield Park.*

A FEW JOTTINGS AT THE DECEMBER EXHIBITION

OF THE ROYAL HORTICULTURAL SOCIETY.

We have had, many of us, our causes of complaint and grumbling at the Royal Horticultural Society's sayings and doings, but I think no one will deny that the Wednesday exhibitions are a great boon, especially in the dreary winter months. It is not merely that they bring together whatever is worth seeing at the season, but that you are sure to meet some one with whom you can have a chat on subjects dear to you, and talk of plans and projects, of future meetings and past successes or failures; so I for one felt grateful on Wednesday last (December 7th), when, after that dreary miserable Tuesday, I found the Council room gay with Cyclamens, Primulas, Orchids, out blooms of *Chrysanthemums*, &c. I am not, however, going to venture upon ground which has already been so well trodden by your reporter, let me note a few things more in detail than has been done, and first

Mr. Douglas's Stand of Chrysanthemums.—Two things were to be noticed in this: First, that there were some of the most perfect blooms of *Chrysanthemums* that could be staged. I very much question whether his bloom of Miss Marechaux has ever been equalled. Fine, too, were Lady Talford, Guernsey Nugget, and other good sorts. And then it was notable that he had ventured upon the innovation of introducing some of the Japanese varieties amongst them, and very well did Comet and the Mikado, with their curious sea-anemone-like forms, contrast with the more perfectly formed show varieties. Whatever Mr. Douglas does he does well.

Mr. Clarke's Cyclamens.—Who that remembers what the culture of this very beautiful flower used to be does not feel astonished at the improvement that has taken place in it? It used to take three or four years to make a good-sized corm, while here were some of really good size grown from seed sown

on January 22nd of this year, so that ten months are sufficient to make good flowering corms. We have succeeded in making our beves and sheep in half the time they used to take, and now we are able to do the same with our Cyclamens. What next? Can anyone contrive to make Auriculas throw offsets and increase more rapidly? Who knows? I pass on from flowers to two inventions which I think deserve notice.

Mr. Chapman's Exhibition Stand for Salads.—Intimations of Mr. Chapman's intention to essay something of this kind had been already given, and his ingenuity in the construction of the flower and fruit cases and other inventions led me to believe that his promise would be fulfilled, and so it was. A very neat tray for exhibiting them is the result. Round the edge is a narrow trough in which Mustard and Cress were growing, while the salad was temptingly displayed in the middle space. This will doubtless be a boon to those who are fortunate enough to be able to exhibit such things.

Mr. B. Looker's Acme Garden Frame and Ground Vinery.—I have already expressed my opinion, formed from personal experience, of the value of Mr. Rendle's plant-protectors, although several have thought they are not so valuable as I believe them to be; but when I think of my Lettuces covered up with a good bed of leaves, I feel that by-and-by I shall have opinions strengthened. Mr. Looker's invention is a combination of wood, earthenware, and glass. The earthenware is very light, something in the form of chains, while the light wooden frame is so contrived that, though light, it gives great stability to the whole structure; and ventilation is provided for along the top, the little earthenware case of which the ridge is composed taking off easily, while the glass can be readily taken out for the purposes of watering. I am inclined to think that this little span-roofed frame will be found a great benefit to the owners of small gardens, as its neatness is quite equal to its usefulness.—D. Dool.

THE POTATO AND ITS CULTURE.—No. 4.

MISCELLANEOUS NOTES.

In sorting seed Potatoes, care should be taken to pick out the weakest eyes, leaving two or three strong ones. One good stiff shoot is sufficient, but one eye is not to be depended upon, for it may be destroyed. This applies to those varieties which have numerous eyes, and to those that are not large enough to make two or more sets.

A new and most excellent variety has lately been introduced into this country under the name of the King of the Sea. About February in the present year I purchased 1 lb. of this Potato, comprising three fair-sized tubers. Of these I made thirteen sets, each set having one eye, and I planted them in a warm border under a south wall about 14 feet wide. I drew out a trench 18 inches wide, and the same depth, laying the soil on each side of the trench. I then applied a compost of wood ashes, leaf mould, very old cow dung, and some well-chopped turf, and as my man threw it into the trench I mixed with it some of the soil which had come out of the trench, and which was very light. I planted the sets rather less than a foot apart, and then covered them with 4 inches in depth of soil. As it was very dry I watered the row. The weather continued very dry, and having little or no water, no more notice was taken of the plants till they began to come up. I then watered them with liquid manure (formed from sheep and fowls' dung), and a week later again with clear water. When they were dry I earthed them up a little, and as they advanced I continued to do so till they attained their full growth. On the crop being taken up the produce weighed 30 lbs. of very large and middle-sized Potatoes. I firmly believe if it had been a favourable season the 1 lb. would have produced 80 lbs. It is an excellent Potato for culinary purposes, and when it becomes more known no doubt it will be very largely cultivated.

Myatt's Prolific Ashleaf Kidney stands next in my estimation both for cropping and for flavour, and is more suitable for dry summers than any variety I know. I grew it extensively this season in a very dry situation, where the soil is of such a texture that it may be termed as light as ashes; I had a very good crop, and the tubers were of fair size.

It is a very bad plan to grow year after year the same kinds of Potato, and in the same situation, for they will assuredly degenerate, and if this course be persisted in will dwindle away. I should recommend after the Potato of one sort has been grown in the same garden or field for two years, it should be removed for a time, and grown in just the opposite kind of soil. In some instances the soil varies even in the same garden. I have

known peat to exist in one part of the garden, and quite a sandy soil in another; and, again, on our farm, there is one field of eight acres, a part of which is very stiff marl or loam, while the top end is very light; the Potato can be grown to every possible advantage where the soil is so divided. I quite agree with the late Mr. Paterson, in saying that maiden soil is the best for Potatoes, especially that which was meadow land previous to breaking up.

I will give an instance of what I did with a small plot of ground which had been used as a cottage garden for, I may say, centuries, and which had been condemned for Potato-growing. I trenched the ground as deeply as possible, sometimes turning up quite a yellow soil, I then planted the sets just as I have recommended under the head of planting, allowing about 14 inches from row to row, and 8 inches from set to set. I flat-hoed once, and never touched the ground again till I took up the crop, when I obtained twelve bushels of good-sized tubers, and two bushels of seed Potatoes. The ground was 12 yards long, and 10½ wide.

I recommend getting the crop in early, and then there is more likelihood of obtaining the produce before the wet and bad weather sets in, whereby decay of the tubers is promoted. The exact time for planting must be left to the discretion of the grower, who will be guided by the weather.—J. C. Lewis, *Gardener and Bailiff, Sudbury Rectory, Derby.*

NOTES ON THE CHRYSANTHEMUMS AT LIVERPOOL.

THERE was at the show nothing to speak of among the Japanese varieties, which was a matter of surprise to me; though their being later in blooming than the other varieties may have been the reason of so few having been exhibited, and the same reason in all probability will lead to their being grown for decoration and cut blooms.

Of the cut blooms, Eva, white, was undoubtedly the first on the list, being followed by Mrs. Heale, Golden John Salter, and John Salter, very good. Bronze Jardin des Plantes was of astonishing size and beauty. Mr. Gladstone was beautiful in colour, but smaller than it might have been. Of Prince of Wales I am sorry to see there are distinct varieties sent out by two different firms, causing confusion among growers. I give the preference to the light red variety, though the other is very fine. Rev. J. Dix showed well up to the front, as did also General Slade and Baron Baust. Yellow Perfection was a very pleasing good variety. Guernsey Nurset and Princess Beatrice were very fine; also Oasian. Of others I noticed Empress of India, a fine bloom, but open in the centre; Isabella Boff, a charming variety; Alma, also a good show flower; Cherub, a very fine bloom; Sir Stafford Carey, which, though placed last on my list, is by no means the worst, but, on the contrary, one of the most striking blooms. The above were the cream of the show in cut flowers.

The plants in the large-flowered section I will take in alphabetical order, Annie Salter being first. This is a well-known variety, and should be in every collection. Aisidne I was sorry to see come out so badly, as it is very fine with Mr. Bronze Jardin des Plantes, very fine, is an extremely useful variety, and Cherub pleasing. Cleopatra also came out well. The Christines, White and Golden, were good, but have, to my taste, too rough an appearance. Faust was very telling. Fingal was also fine, but rather loose and open-centered. Florence Nightingale, a very useful, good variety, was shown in good condition. General Bainbridge is a very fine late variety. Gloria Mundi, fine free variety, was rather too far gone. Hereward, a very fine flower, is very effective. Jardin des Plantes was one of the finest. John Salter is likely to be generally grown. Julie Lagravère was about the only one of its colour shown very good. Lady Harding and Lady Slade were both very fine, and are two very useful varieties; but Lady Talford is grand; it struck me at once, and was shown well in several collections. Lord Derby is a very good dark purple; Mr. Brunlees a very large flower and good; Mr. Cullingford, though one of the best, I do not remember seeing. Mrs. G. Randle was very fine in one collection only. I found it was faulty in several collections, as it is with me. Mrs. Hulburton was more like a Dahlia than a Chrysanthemum; this is a good variety, and is to be depended on. Pink Pearl was very good, but I have not Pink Perfection down in my notes. Prince Alfred was very fine, but inclined to be open in the centre. Sir Stafford Carey seemed to be a favourite with several ex-

hibitors. Fleur de Marie, a large, white Anemone flower, was very effective.

Coming to the Pompons, Adèle Bisette was very beautiful; the same is true of Andromeda. Aurore Boreale was charming, the colour being so varying. Bijou de l'Horticulture (a long name, truly), an odd variety, was very good, and Bob was better than usual. Dina Dina was smaller than I am accustomed to see it. Hélène, a fine rose-coloured flower, showed out well; but Lizzie Holmes was better. Middle, Marthe was also fine and effective. Of the Anemone-flowered Pompons Cado Nulli was very fine—in fact, the most perfect specimen in the Hall; and Mrs. Wyness, a very fine free-flowering variety, came out in the front rank.—STEPHEN CASWELL, *Bent Hill Gardens, Prestwich, Manchester.*

PLANTING.

No time could be better than this for planting and re-planting all kinds of evergreens, and planting for shelter, for profit, and for cover. The ground is now almost moist enough for common purposes, and still, notwithstanding the late frosts, retains much of its summer warmth. We are rather pleased that some remarkably on planting have drawn considerable attention to the subject, and more especially to the importance of planters in exposed places paying more attention to the number of times the plants have been moved, and the distance they stand apart, than to their mere size or height. In nothing more than in planting will it often occur that the cheapest goods are by far the dearest, if not worthless and useless in the end. It is not the fault of our tradesmen who deal in trees and shrubs. People will have things cheap, and the nurserymen to live must occupy as little ground with them as possible. They would only be too glad to send out sturdier hardier plants if purchasers would consider that it was to their interest to give a better price for a better article. As a case in point, we may mention that two or three years ago a lot of Larch was taken to an exposed place. The sight of the nice trees, with their smooth bark and slender twigs, would have shown us, even if we had not otherwise known, that these trees were taken from nursery rows where each stem pretty well rubbed its neighbour stem, so thickly did they stand, one thus protecting the other. To turn out such close-packed trees in an exposed place at 4 feet apart and like turning one out of a cosy room into the clear sky of a cold night. Very few of these plants survive—none thoroughly healthy—and the life of a valid or a care was sufficient to kill them. At the same time and place other Larch trees were planted, not taller, but much more bushy, and with rough hardy stems, the plants having stood 15 inches or more apart in the rows. Not one of these plants gave way, even in the bad seasons which destroyed the others; and the other day we noticed that many made long leading shoots last summer, and no Larches could look more healthy and flourishing. They cost about double the price of the trees first alluded to. For a definite, sure, pleasant result, they were well worth from three to four times the money of the others; and as we think they had been at least twice replanted, of course the work and the extra ground would have to be paid for. One thing in their favour was, they were carefully taken up and quickly and carefully planted.

This leads us to restate—and the planting time is our excuse—that if we were to plant largely in the way of woods and cover, we would not trouble ourselves with seeds or raising young plants, as the seedmen and nurserymen would thoroughly bear us in that, but we would have a little nursery of our own in which we would keep the trees a year or two after receiving them from the nurseryman, and by giving them more room than the dealer could be expected to afford, we would thus prepare them for more exposed positions. Another great benefit we should derive would be our being able to lift our plants just as we wanted them, and not too many at a time. When trees that come from a distance do not succeed over-well, we are apt to forget how the roots may suffer in trucks and waggons during the uncertainty of the winter months; and when, from the vast numbers obtained at a time, a considerable period must elapse before they are all planted, those who have no such home-store to go to, and resolve to plant this season, will act wisely, in our opinion, when ordering from their nurseryman to make inquiries, not merely as to the height of the plants, but as to the times they have been moved, and the distance they stand from each other. Great disappointments often take place because mere height and price are the only considerations; many a man would give a

double price to have a triple assurance of success. The thinner plants stand, so as to so far *un-nursery* them, the more they must be paid for, and the more fitted will they be for exposed cold situations.—R. F.

PLANTS IN FLOWER DURING NOVEMBER.

- Nov. 2. Hedera Helix arborescens
- Hedera digitata
- Jasminum nudiflorum
- Asplenium adnigratum
- Potentilla alba
- Collinsia bicolor
- Dianthus Caryophyllus
- Lactuca
- Aster
- Moric Pare
- Spiraea
- Petraeus
- Crucifera stylosa
- Monarda purpurea
- Primula acuminata
- Arenaria hirsuta
- Claytonia perfoliata
- Eragrostis alpinus
- Villarsii
- Andria deltoidea
- Mooriana
- Delphinium Belladonna
- formosa
- Cyclamen europaeum
- Jasminum puberulum
- Phlox Drummondii
- Ebermeierianus scabell
- Lonicera Douglasii
- Aconitum autumnale
- Villarsii
- Pyrethrum roseum
- Panthium plenum
- Golden Feather
- Escallonia rubra
- Lycocotria formosa
- Callirhoe platyglotta
- Rudbeckia fulgens
- Saponaria tuberosa
- Ecklonia metallica
- glauca
- secunda
- Echinops bunnianus
- Aster grandiflorus
- Tropaeum
- Myosotis poliflorus
- Antirrhinum majus
- Tactes patula
- Crocus scirvus
- Beyci
- Hammulis virginica
- Garrya elliptica
- Aporosa umbellata
- Saponaria tuberosa
- Centaura scabellifera
- pinnatifida
- 5. Nepeta violacea
- Godalia rosea
- Colebitum autumnale plenum
- Festuca ovina
- Vernonia
- Rose Glabre de Bion
- Mentha China
- Cerasus China
- Chrysanthemum
- Fuchsia coccinea
- globosa
- Anagallis speciosissima
- Phlox procumbens
- various
- Konica maritima
- Hydrangea hortensis
- Polygona Sibboldii
- Thymus compactum
- Gilia tricolor
- Ornithoglossum
- Cedronella
- Hesperis matronalis
- Nictandra gracilis
- Pumilio Larente
- capensis
- Anagallis alata
- Clematis Jackmanni
- Clematis fruticosa
- maritima
- Sylvia coccinea
- fulgens
- Aragal's grandiflora
- Tricyrtis hirta
- Verbena venosa
- Hollyhock grandiflorum
- Verbena pulchella
- Malope grandiflora

- Nov. 5. Campanula pentagona
- mirabilis
- carpatia
- pyramidalis
- Daisies, double
- Gynerium argenteum
- Blachycome ibidifolia
- Erinus alpinus
- Tropaeum majus
- Ceratium tomentosum
- Aster chinensis
- Tropaeolum pererinum
- Coronilla varia
- Mirabilis Jalapa
- Eubicus atrosanguinea
- Andrilla major
- Anemone japonica
- Dracopisium moldavicum
- Chrysanthemum nanum
- Salvia Herbimaria rubrum
- purpureum
- Centaura Cyanus
- Nigella hispanica
- Veronica dentata
- incana
- speciosa
- spicata
- Rose Mrs. Bosanquet
- Arenaria alpina
- Gum rivale
- Solanum paniculatum
- Solanum nigrum
- Oxalis rosea
- Petunia grandiflora
- Tetradlea arvensis
- Hibiscus africanus
- Leptodermis
- Nemorola inodora
- Lupinus novus
- inamabilis
- Celsus eretica
- Linaria hepatica
- Centaura virgata
- Ochlocha pulcherrima
- Polygona truncata
- Lobelia spicata
- 14. Arbutus Uxelo
- Meconopsis aurea
- Hypocistis edycinum
- Xeranthemum purpureum
- Mithella annua
- Convolvulus mauritanicus
- 15. Adonis autumnalis
- Linum catharticum
- olium
- Lysimachia ciliata
- vulgari
- Centranthus cyathiflorus
- Althaea chinensis
- Coccyopsis erantiora
- Asteris nana coronaria
- Clarkii pulchella
- Delphinium Ajacis
- Consida
- Armeria maritima rosea
- vulgari
- Calandrinia officinalis
- Gnaphalium fontinale
- Zinnia americana
- Calyceanthus dentatus
- Erica stricta
- ramiflora
- Calandrinia speciosa
- Alyssum compactum
- Clematis florida
- Vilba
- 25. Athanasia annua
- Apatina celestis
- Lupinus polyphollos
- Achillea Ptarmica fl.
- Viburnum Tinia
- lucidum
- 26. Vinca major
- minor
- Viola odorata
- tricolor
- Statice Linochora
- Chelone barbata
- Linaria alpina
- Cymbalaria
- purpurea
- Daphne Genkwa
- Laureola

—M. H., Achlam Hall, Middlebrough-on-Tees.

WONDERS OF AN AMATEUR.

I wonder why, among all the remedies suggested for worms in pots, the simple one of mustard and water is never mentioned. I have used these ingredients—a teaspoonful of mustard to a gallon or so of water—applied when the soil in the pot is somewhat dry, and have found the result most successful. Not only is the enemy dislodged, but the looker-on has the gratification of seeing him come to the surface as soon as the liquid is applied. I may add, that I have never observed

any injury result to the plants from this treatment, though I have tried it both in the case of bulbs and of hard and soft-wooded greenhouse plants.

I wonder why we amateur gardeners are so often advised to turn out our Camellias into hot pits while they are making wood, and then to keep them out of doors till late in the summer. For two years I have treated half of my Camellias in this way, and have kept the remaining half in a shady part of the conservatory with little other attention than watering and syringing, and have found those treated in the latter method greener and healthier in appearance, earlier in their blossom, and equally full of bloom buds—buds, too, which are not so liable to fall off as they are from plants which have been exposed to change of temperature.—R. S.

HOT-WATER CIRCULATING DOWNWARDS.

I have read the letter written by "POOR GARDENER" (page 370), in which he laments the water not circulating in his fernery owing to the pipes being a trifle lower at the end farthest from the boiler. He will not believe that water will go down hill in pipes; therefore, it may interest some of your readers, as well as "POOR GARDENER," to know that water will easily flow down pipes. We have a greenhouse where the flow-pipe enters at one end, and in the entire length of the pipe the fall is 22 feet, the rate of the fall being 10 inches in every 4 feet. There is an air-pipe fixed in the top of the fall of pipes, and another at the elbow at the other end of the house. The return-pipe goes back to the boiler on a level, and I have not found any difficulty in keeping out the sharpest frost we have had during the last two winters.—R. GIDDINGS, Gardener to W. H. Michael, Esq., Cholmeley Park, Highgate.

[There can be no question as to heated water going down if the proper conditions are attended to. We never like a hot-water pipe to go lower than the boiler, but we understand the present Mr. Weeks and his veteran father, who paved the way for all improved heating by hot water, got over that difficulty likewise. Meanwhile we would rather have every hot-water pipe above the level of the boiler, except where the pipe returns to the bottom of the boiler. At the same time we do not consider the arrangement of heating you have in your greenhouse, and that which a "POOR GARDENER" has to contend with, as at all desirable, because additional air-pipes are necessary. With your air-pipes you need have no difficulty, but the "POOR GARDENER" is not allowed to have an air-pipe, and in such a case, in general, free circulation would be impossible. The more, from different causes, that the water varies and sinks in level in the pipes, the greater will be the tendency of air to accumulate at the highest point, where the piping enters the house; and if the air there should fill the pipe from top to bottom, even though the length of the tube of air should only be a few inches, a strong fire would be more apt to burst the pipe than make the heated water pass through the air. A small body of air thus shut in between two bodies of water becomes pretty well as impassable as a firm wedge of marble. Have an air-pipe there and always open, and there will be no confined air, no stoppage to the water's circulation. The late Mr. Weeks had taps and pegs in such places. We are not sure who first used the small open pipe. Your kind statement would have been in unison with the answer given at page 370, but for the mistake of leaving out the word "not." A period should read thus—"The air-pipes might be tried before lifting the water-pipes, but if even that be 'not' done, the heating will never be properly effected," &c. Where there is much pressure, it is as well to have the end of the air-pipe outside the house, and the end bent a little downwards, as then it is less likely to get clogged with dust, or from insects lodging in it. A small gas-pipe answers admirably.]

NEW BOOKS.

The Miniature Fruit Garden, or the Culture of Pyramidal and Bush Fruit Trees, &c. By THOMAS RIVERS. Longman & Co. Sixteenth Edition.

We do not usually notice new editions, but of such a popular work as is this, and its being the sixteenth edition, we make an exception, though only to quote the following from its preface:—

"As a prominent but not new feature in this enlarged edition, I may refer to the management, and above all the protection of low luteran cordun fruit trees. I have also pointed out more forcibly than in former editions the capability of growing choice Pears and Apples

in any low cheap walls, and also against walls in kitchen gardens not fully furnished with trees,—in short, in all bare spaces so often found between wall trees in old gardens. These methods of cultivating Noisette Peas and the finer kinds of American Apples are worthy of much more attention than they have hitherto received.

"The method of cultivating the Prince Engelbert, and one or two other kinds of Plums as vertical single cordons, has been practised here for some few years; it is original, highly worthy of attention, and may be made a profitable venture, not only for the amateur but for the market-gardener.

"The management of those charming structures—ground vinerias, in this edition more fully gone into than before; in short, all the modes of culture hitherto recommended have been revised and made as perfect as practice can make them, for it must be recollected that all the modes of culture here recommended have been well tested, and no foreign practice recommended till found adapted to our wet English climate, the mean temperature of which is just about two degrees too low for the choice kinds of fruits to ripen without assistance."

The Lectest Sugar Question. By E. F. DE MAN. London: Ridgway.

We warn our readers against throwing away 3s. 6d. on this ill-written, unpractical pamphlet. There is not a suggestion in it that is useful, and long French quotations are given for no better reason than that they "will read more gracefully, especially for the fair sex."

DECEMBER CATERPILLARS.

It is a little remarkable that the caterpillar of the Butterfly, which claims the highest rank amongst our "Britishers," passes the winter in a torpid state. For this reason it may be considered remarkable, that to an extent it may be assumed that there is a certain check to the increase of a species, for in some winters many of these hibernating caterpillars must perish from various causes. Few have been so fortunate as to find the caterpillar of the Purple Emperor (*Apatura Iris*) at any stage of its growth; and for an account of its early history in particular we are indebted to the researches of Dr. Maclean. The egg is very much like a fossil Echinus in miniature denuded of its spines, and the little Emperor (to be) quits his shell about the end of July. Changing its skin in a week's time, it then exhibits two curious horns attached to the head, each of which is seen to be slightly cleft. Dark brown, too, when first hatched, it has now assumed just the tint of the Sallow on which it prefers to feed, though occasionally it is found on the Oak, according to the oldest observers. The mode of aiding digestion adopted by the young caterpillar is curious: having eaten its fill off some leaf, it then marches to the tip, and fixing itself there, remains motionless, raising its head in the air in the manner of the Peas Moth caterpillar. Some time in November it seeks out a twig to its taste, and forms a slight silken web on the bark, and on this it rests extended at full length, with the horns pressed together, and awaits the favourable influences of spring. When larger, this caterpillar rests in an almost straight position, though Mr. Newman observes that "when feeding, it bends its somewhat obese body with the facility, and I would almost say elegance, of a slug; but I fear many of my readers will scarcely appreciate the comparison. If annoyed, it contracts its body, assuming a very lumpy appearance." The peculiar horns on the crown are now established in their matured state, and are seen to be roughened over with small points. They have no separate power of motion, waving to and fro with the head. In colour they are greenish blue, with black tips. The whole body is slug-shaped, tapering at both extremities, and crossed by several transverse rows of warts. At the anal extremity are two points nearly parallel. The general colour is green, white on each side, in the line of the spiracles, there runs a slender yellow stripe; starting from this are seven oblique yellowish-white stripes, which slope upwards, but do not reach the middle of the back. The under surface is also green. The head of the chrysalis, which is seldom found, terminates in two short joints, and the body of it shows faintly the oblique stripes which adorn the caterpillar. The nearly adult caterpillar of the Marbled White Butterfly referred to last month, lives solitarily near or on the surface of the ground through the winter. There is a species much inferior in size to the preceding, but an entomologist records that he has several times observed, in the woods of Northamptonshire the attacks made by the Marbled White on his imperial relative, when he descends to the lower regions of the air, or settles in some damp spot.

A pleasant sight is it in a woodland walk to see the graceful

movements of the Speckled Wood Butterfly (*Pyrarga Egeria*) as it passes along the "ridings" or skims over them. The caterpillar producing it may be found in December, as also in other winter months. The eggs from which the winter brood emerges are laid in July or August. The young caterpillar feeds on various grasses, and does not grow much before it hibernates. Sepp, a continental naturalist, reports that specimens he had, changed their skins five times before winter. The head is black when the caterpillar is first hatched, but with the first moult it becomes green. With the growth of the early grasses in spring this little creature begins again to feed, and rapidly increasing in size, is generally full grown by the end of March. The body of it is shuttle-shaped, the divisions of the segments being clearly marked, and each being slightly wrinkled, which gives the appearance of their being again divided; at the anal extremity are two parallel points. The whole surface is covered with small raised points, from each of which there rises a stiff bristle. The general colour is sometimes olive-green, sometimes an umber-brown; in both kinds we have three stripes, each of which is triple, being composed of a dark smoke-coloured central stripe and two yellowish or whitish stripes. The chrysalis is fastened to a silken web on a grass stem, or some plant near the food of the caterpillar. There is also supposed to be a summer brood of the caterpillars of the Speckled Wood. The caterpillar of the Wall Butterfly is closely allied to the preceding, and the two Butterflies resemble each other in one singular particular—they have the eyes hairy. Hibernating individuals of the autumn brood of the caterpillars of the Wall (*Pyrarga Megara*) rest upon low herbage, close to the ground from September till March usually, nor do they appear to eat during that time, as is the case with some grass-feeding caterpillars amongst the moth tribes. The caterpillar of the Wall feeds chiefly by night, remaining through the day with its body extended along a blade of Grass. In many respects it resembles the one just described, having a similarly shaped body, with anal points, and being also studded with minute warts. The colour, however, is apple-green, the head being of a deeper and duller tint, and also a narrow stripe down the back; there is a pale greenish-white stripe along the sides; the legs are almost colourless, and half transparent, the claspers being of the same colour as the body; the points at the extremity are tipped with pink. When of full size, this caterpillar suspends itself by the tail, and becomes a chrysalis, the Butterfly emerging in May.

A good many of the caterpillars belonging to the extensive family of the Noctua live from autumn on to the spring or summer. Amongst these are several belonging to the genus Noctua, individuals of which turn up occasionally when the entomologist is digging round the roots of trees in fields, or when he is examining the sparse herbage along the hedge-banks. The caterpillar of the Double Dart (*Noctua Augur*), though a feeder upon Whitethorn and Sallow, usually passes the winter near the roots of low plants. The head in this species is small and slightly notched, and Mr. Newman observes that when crawling it "stretches the head forward, and moves it about in a leech-like manner." This caterpillar has a very smooth body, of a dull purple lue, varied with darker markings, and along the line of the spiracles there runs a stripe of rich brown; upon the back there are some white spots arranged in pairs, part of these being indistinct; the legs and claspers are pale and look nearly transparent. It attains maturity in the month of May. A rare and pretty species is that known as the Lesser Ingailed (*Noctua confusa*), in England apparently occurring only near Darlington, and being restricted in Scotland to two or three localities. The eggs are laid in the summer upon low plants indiscriminately, though the caterpillar seems most partial to the leaves of the Moss Campion. Unlike some of its brethren, it attains a good size before hibernation. The head is smaller than the second segment, almost round, having upon the face two crescentic marks, placed back to back. The body is greenish-yellow, with fine lines of brown distributed over it. The straight stripe, nearly white, runs down the middle of the back, while on each side of this, from the fourth to the tenth segment, is another stripe, and between this and the upper one there is a black spot on each segment. The spiracles are black, surrounded with white; the feet are black at the tips, the claspers much paler than the body. The cocoon is ingeniously constructed by the adult caterpillar of particles of leaves, mixed with earth, and interwoven with silk. A very rare British moth is that called the Feathered Ear (*Pachetra leucophaea*), apparently confined entirely to one locality in Surrey (near Mickleham), where it might be worth the while of collectors to hunt

for the caterpillar, which has been described by Guenée, the acute German entomologist. He has found it feeding on "tufts of grass on commons, and in dry woods." The head is large and light brown, giving the caterpillar an odd appearance; the claspers are small and short. The body is velvety, and yellowish grey; along the back there is a very conspicuous stripe, and below this on each side, a faint stripe, and another, also indistinct, in the line of the spiracles; in the second segment there is a brown plate, with a shining surface. Abroad, the cocoon is made amongst Moss in April, the moth appearing in July.

The caterpillars of the Mottled Rustie (Caradrina Morpheus) feed throughout the winter at intervals when the weather is open; at other times they rest on the under side of decayed leaves, or even enter the earth for a short distance. They may be sought on Docks and other plants which are green through part of the cold season. The body is very plump, the head less, and over both these are numerous short bristles. The colour is brown, varying in tint, with markings along the sides of a wedge-like appearance, of a darker hue, and a pale line below these. The species occurs in many places throughout England. Another in this genus has a singular history. This is the Pale Mottled Willow (Caradrina cubicularis); the name, from cubiculum some have believed to have been given because it occurs in outhouses or barns; Mr. Newman believes that the authors of the name gave it "in allusion to the familiar habit of the caterpillar residing in a little cubiculum or lodging-room of its own construction." The moth lays its eggs in June on Peas or Beans growing in fields, and still more frequently on the growing Wheat. When these crops are cut down and housed, the caterpillars of this moth are, much to the disadvantage of the farmer, carried in with them. Here they feed through the winter, forming the temporary cocoons already referred to, as they move from place to place, being nearly full grown in early spring. These caterpillars have the body studded with warts, each giving off a hair; the body being short and thick, and the head rather small, and capable of being withdrawn beneath the second segment, the surface being shining and black. The upper surface of the body is a dull grey, sometimes greenish, the sides are smoky grey, the under side and claspers much paler. The Froated Orange Moth (*Gortyna flavago*) would probably become very common, were it not that the caterpillars are many of them destroyed before they are full grown by the attacks of an insect enemy. It has afforded matter for some speculation as to the mode in which the egg of this parasite is introduced, since the caterpillar lives entirely concealed in the stems of plants, such as the different species of Thistle, Burdock, Mullein, and Hemp Agrimony. When removed from this retreat, it does not roll up, but crawls off rapidly to seek some concealment. The stems of some of these may be examined for this caterpillar in December, though as yet it has been mostly found in this summer; if taken it must be transferred of course to some transplanted specimen of its particular food. The formation of the body is admirably adapted to its life as a feeder upon the pith of plants, being soft, maggot-like, and pliant. The head is horny, flattened, of a yellow colour; there is also a horny plate on the second and one on the last segment; these plates are brown, the rest of the body being dull white, tinged slightly with pink. There are a number of dots arranged more or less regularly on the back and a few on the sides; the legs are horny but not the claspers. The chrysalis has a curious projection in front of the head, and two sharp spines at the tail, by means of which it extricates itself from the stem when about to become a moth.—J. R. S. CLIFFORD.—(*English Mechanic and Mirror of Science*.)

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

STENOGLOTTIS FIMBRIATA (Spotted Natal Orchid). *Nat. ord.*, Orchidaceæ. *Lin.*, *Gynandria Monandria*.—Native of Natal and other Cape of Good Hope districts. Flowers lilac, with purple blotches.—(*Bot. Mag.*, t. 5872.)

GLADIOLUS SAUNDERSII (Mr. Wilson Saunders's Gladiolus). *Nat. ord.*, Iridaceæ. *Lin.*, *Hexandria Monogynia*.—Native of Cape of Good Hope. Flowers scarlet and white.—(*Ibid.*, t. 5873.)

CASSIA MIMOSOIDES var. TELFAIRIANA (Telfair's Mimosa-leaved Cassia). *Nat. ord.*, Leguminosæ. *Lin.*, *Decandria Monogynia*.—Native of Zanzibar, and elsewhere on Africa's eastern coast. Flowers yellow.—(*Ibid.*, t. 5874.)

EULOPHIA HELLEBORINA (Helleborine Eulophia). *Nat. ord.*, Orchidaceæ. *Lin.*, *Gynandria Monandria*.—Native of Sierra Leone. Flowers white tinted with pink.—(*Ibid.*, t. 5875.)

TACSONIA QUITENSIS (Quito Tacsonia). *Nat. ord.*, Passifloræ. *Lin.*, *Pentandria Trigynia*.—Native of the Andes in New Grenada and Ecuador. Flowers pink inside, crimson outside.—(*Ibid.*, t. 5876.)

GEISSORHIZA GRANDIS (Large-flowered Tile-root). *Nat. ord.*, Iridaceæ. *Lin.*, *Triandria Monogynia*.—Native of the Cape of Good Hope. Flowers pale straw-coloured.—(*Ibid.*, t. 5877.)

GLOXINIAS—*Scarlet Gem*, *Negro*, and *Mlle. Jeanne Prevost*.—"Few genera of ornamental plants are more useful in their way for general decorative purposes than the *Gloxinia*, which to facility of culture adds the recommendations of convenience of size, variety of form and tint, profuseness of flowers, and a velvety richness of colouring which is almost unapproached. Need we wonder, then, that they are largely grown both for house decoration and for exhibition—though not much encouraged at the great London shows; and, moreover, that the varieties are very numerous?"

"Their culture is so simple and well understood, that we need not here devote space to explain it. Suffice it, then, to say that the variety *Scarlet Gem* is one of the richest and brightest flowers we have ever seen, and one which unanimously won a first-class award when exhibited last spring. The colour at the deepest parts is of a rich bright velvety tint of carmine scarlet, beautifully blended with a soft violaceous hue at the throat. This novelty was shown by Mr. Williams, of Holloway. *Negro* is a richly shaded violet purple, raised last spring by the Messrs. Veitch & Sons, amongst many others of great beauty and merit; and *Mlle. Jeanne Prevost*, a French variety of recent introduction, is a deep rosy lilac tint, beautifully spotted and rayed with violet in the month and throat. They all belong to the erect-flowered section of *Gloxinias*."—(*Florist and Pomologist*, 3 s., iii., 265.)

"A PENNORTH O' POT-HERBS."

"HERE'S your pot-herbs, a penny a lot!" Such is the announcement addressed, in stentorian tones, to the discerning public, by the proprietors of numerous stalls ranged on either side of Whitecross Street, St. Luke's.

My readers may probably not be acquainted with this locality. It is overshadowed by the vestige of the old prison, but adorned by public baths and wash-houses for the labouring poor, and illumined by the "Tabernacle," in which are held meetings for the moral and intellectual improvement of the costermongers and their families, and in which hundreds of their children are daily taught how to tread the path of life here, so that it may lead to realms of love and light hereafter.

Some people call this a "low neighbourhood," but I do not. I recognise the principle that where there is an up-hill there must be a down-hill. Wherever there is a high light, there must be a deep shadow; and therefore, as surely as the Pyramids have reared their summits for ages above the ground, even so surely did the nummulites, of which their structure is formed, work for countless ages in the depths of the sea; and as certainly as the mighty-winged albatross sails high above the ocean at a thousand miles from shore, even as certainly does the humble earth-worm penetrate the ground deeper than man can reach, so enabling the rain from heaven to sink and fertilise the soil. There is no occupation low so long as is honest; and thus we realise the words of the poet—

"Let every work be hallowed
That man performs for man;
And have its share of honour,
As part of one great plan."

Along the kerb on either side of this and the neighbouring streets are all sorts of arrangements for selling goods. These alone furnish, as it were, a complete record of the progress of shopkeeping; and, as the history of architecture has been called the history of the world, so in the gradual development of these stalls may be found the history of the growth of our magnificent shops, with their plate glass fronts reaching up to the second floor—even as it has been said, the hovel grew into the palace, and the cave became the temple.

Here is to be seen the most primitive form of stall—the supports being the legs of the proprietor, around whose neck an old tea-tray is slung. On this are sometimes displayed a few sheets of note paper and envelopes, a stick or two of very thin sealing wax, some pencils and pen-holders. Sometimes the edge of the tray is bent perpendicularly upwards, so as to form a wall; and in this case the article exposed for sale is a little pair of wheels made of wire; on the axle is fixed a small doll, which is wheeled along on this primitive bicycle by jerks on

either side of the tray, to the infinite delight of the juvenile population, who look up to these toys as the realisation of all that money can purchase. Sometimes the tray graces the neck of a woman, and contains a few yards of edging or insertion, wound round a blue card; a cap or two of her own make; a kettle-holder made of patchwork; a few yards of tape; a card of looks and eyes; and a strip of plus;—the whole stock worth so little—yet by this alone must the poor creature maintain herself and children!

Next comes a tray, supported on a pair of slight trestles, usually the centre from which is distributed a composition for cleaning cloth, &c. The use of this requires a basin of water, and necessitates that the eloquent vendor should have the free use of his hands, so as to be able to prove the efficacy of his preparation by removing stains of paint, grease, &c., from the jackets of all "believers."

Now we have the costermonger's barrow, piled up with vegetables, of which an extraordinary supply may have turned up in Covent Garden in the morning—Cabbages, Cauliflowers, Lettuces, &c. This is essentially a locomotive stall; the proprietor does not find it to his advantage to remain long on one spot, knowing that many of the women cannot come out to buy their vegetables, having work at home—shoobinding, machine working, and above all "the children" to look after. My informant told me that, rising at 3 A.M., he gets early to Covent Garden—buys Cabbages, Turnips, Rhubarb, Cauliflowers, or other vegetables, which he hawks during the morning; usually getting rid of his stock by about 12 o'clock. He then invests in Cherries, Apples, or such fruit as may be in season, which he sells during the afternoon, generally taking up his position (if the police allow him) somewhere near a school, just before 12 or 2, or from 4 to 5. In the evening he stocks his barrow with bloaters for supper, or oysters when in season.

Thus are the man's entire faculties, mental and physical, devoted to earning an honest subsistence, requiring as much watchfulness as to supply and demand, and the rise and fall in prices, as do the merchant and stockbroker; for, said my hopeful "coster," "Mr. —, and many others now in a large way of business, only begun as I did." He told me, too, that several costermongers not only use their own donkeys, but have bought others with their savings, and let them out by the day.

These vegetable stalls may be said to keep up a certain amount of business all day and all the evening; for when the whole stock has not been sold before dinner, the remainder is disposed of as night approaches at lower prices; little heaps are made, consisting of a few Turnips, Carrots, Leeks, Onions, a small Celery or part of one, a little Parsley; and these are the "lots" forming the subject of the proclamation which is the keynote of this paper.

And now let us see the purpose which these "pot-herbs" serve in the preparation of food; and I hope to show that they not only contain in themselves a certain amount of nourishment, but that they increase the value of the small quantity of meat which the wife of a working man may be able to place on her family table.

Everybody knows that fat and water will not mix; but that, whilst the water is hot, the globules of fat are separated and held in suspension in it; and as the water cools they unite again, and form a cake at the top.

Take a glass bottle, and partially fill it with warm water; add to this some melted fat, gradually heat, and stir it. Whilst the water is hot the fat will seem to mix with it, but as it cools it will rise to the top and form a cake. Again apply heat, and this time add a teaspoonful of brown sugar, stir it, and allow it to cool; behold, the cake of fat at the top will be just half its previous thickness. But follow up the experiment: apply heat a third time, add a teaspoonful of gum—allow it to cool—and you will find that the cake of fat will almost entirely disappear. Where has it gone to? The answer must necessarily be, that it has entirely mixed with the water.

Here then, is the secret of the use of the "penn'orth o' pot-herbs."

If we analyse 1 lb. of Carrots, we shall find amongst the ingredients of which the vegetable is composed, 1 oz. 11 grains of sugar, and 70 grains of gum. In 1 lb. of Turnips we shall find 280 grains of sugar, and 107 grains of gum. So that, we see, these two vegetables perform exactly the same office as the sugar and gum in the experiment, and thus utilise the fat in the food by causing it to mix with the other ingredients, and so enabling us to take it without the disagreeable effects previously alluded to.

But this is not all; these pot-herbs (and I have selected

these two as types of the class) not only serve as mediators, but bring in themselves a certain amount of capital into the concern; for we find in 1 lb. of Carrots 42 grains of albumen, and in the same quantity of Turnips 77 grains of albumen and casein. Further, in Carrots we find 1 grain, and in Turnips 35 grains of mineral matter; and the comparative importance of this will be recognised when we remember that in the body of a man weighing 154 lbs. there are 8 lbs. of mineral matter. But even this is not all; were every particle of the substances that we put into our stomach really digestible, the mass would become so closely pressed together that it could not be penetrated by the gastric or intestinal juice. Nature has guarded against this by giving us in our vegetable food a substance called cellulose, or woody fibre. This forms the walls of the little bags in which the starch and sugar in the plant are packed up; it is this which, when the sugar has dried away or rotted, causes the vegetables to become what is called "stringy" or "woody." Of this woody fibre we find in Carrots 231, and in Turnips 168 grains per lb.

The limits of this paper preclude my pursuing the subject any further. I can only just mention the tastiness which these plants impart to food. Who does not know the exquisite flavour added by the simple spike of Parsley, or blade of Celery? Who does not recognise the pungency of the Onion (in itself a nutritious and most healthy vegetable) or of the Shallot? And one word more—who does not look with wonder and admiration on the beautiful colours of the Beet and Carrot, and on the exquisite form of the leaves of the Parsley and Celery? And who is there that would say that a poor man would not enjoy his meal all the more, if the little piece of meat which has been boiled in his soup were served up nicely garnished with the gold and scarlet slices of Carrot, the silvery wedges of Turnip, and the emerald foliage of the Celery and Parsley? Thus to economy may be added beauty—beauty leads to refinement—and who shall say where refinement may lead? Need we, then, any more ask, What is the use of "A penn'orth o' pot-herbs?"—*ELLIS A. DAVIDSON.—(Food Journal.)*

ROYAL HORTICULTURAL SOCIETY'S SHOW AT NOTTINGHAM.

The preliminaries of the great provincial meeting of the Royal Horticultural Society at Nottingham, are now settled. The Show is fixed for the 27th of June next, and is to be held in the Castle Park, quite in the centre of the best part of the town. The special prizes already amount to £380; many more are yet expected, and the guarantee fund is complete. Well done Nottingham! If this meeting is not a success, it will not be for want of the will and energy of those who have undertaken the initiative to make it so.

CHRYSANTHEMUM CULTURE.

Your correspondent's remarks in your last issue seem calculated to mislead, for my experience teaches me that to produce creditable specimens manure water is indispensable. My practice is to give weak liquid manure at every watering, from the time they are placed in 8-inch pots till I can discern the colour of the flower buds, when I gradually withhold it. I also attach great importance to plunging the pots in some waste material—such as cinder ashes or old tan. Nature has, with few exceptions, provided the roots of vegetation with an equable temperature. Surely, then, it must be beneficial to the Chrysanthemum to protect its roots from solar influences. I have found the middle of July quite late enough for the last potting. It is generally admitted by experienced plant growers, that flowering plants should well fill their pots with roots previous to the formation of flower buds, in order to induce a greater profusion of bloom. This rule is applicable to the Chrysanthemum, but the plant must fail to accomplish this object if potting be deferred till August, as recommended by your correspondent.—*H. BENHAM, Upper Holloway.*

NOTES AND GLEANINGS.

The pods of the Ground Nut (*Arachis hypogea*) are frequently to be seen in the windows of small shops in the poor neighbourhoods of our large towns, where they are chiefly purchased by children, and are known to them as "monkey nuts." Their chief use, however, remarks *Nature* is for the expression from the seeds of a light-coloured bland oil, said to be extensively used for mixing with olive oil; and we have

even heard of the seeds being parched and used as a substitute for coffee, but we now read that in America they are used for making chocolate (so called); for this purpose they are beaten up in a mortar, and the mass compressed into cakes, and it is said to form a most agreeable chocolate without a particle of true cocoa. More than this, the Americans prepare the seeds as a dessert sweetmeat by parching them and beating them up with sugar.

NOTES MADE DURING A TOUR IN IRELAND.

No. 4.

THE VICE-REGAL LODGE, PHENIX PARK.

NEXT to royalty—royalty itself in Ireland—is the Lord-Lieutenant, and it is meet he should enjoy a royal abode. Such is the Vice-Regal Lodge, situated in the middle of the noble Phoenix Park; no better spot could be found, for it commands fine and extensive views of the Park in all its varied beauty, and of the surrounding country, with the Dublin mountains and other hills in the distance. The building is plain but elegant, substantial, and large. The private policies and gardens are of considerable extent, nicely furnished with trees, tastefully laid out, and pretty well maintained.

In the immediate front of the Lodge a square portion of about two acres bounded on three sides, south, east, and west, by a low balustrade wall, is very beautifully designed as an ornamental flower garden. There is a massiveness, a width, and a character about this in perfect harmony with the building that I liked very much; moreover, it was skilfully and tastefully planted, and in perfect keeping, which made it quite pleasing to look upon, and it reflected much credit on Mr. Smith, the very excellent and intelligent gardener.

The accompanying sketch, for which I am indebted to Mr. Smith, will give a far better idea of it than any mere description. Only one half of the design is here shown, as the other is precisely the same.

The Vice-Regal Lodge (A), a photograph of which is shown, stands on a flat plateau of grass, with a long broad gravel walk in front, and another walk leading from the portico, B, through the centre to another broad raised terrace walk against the low balustrade wall on the opposite side, which forms a beautiful promenade, overlooking the Park on the one side, and the flower garden, with the Lodge, on the other. That which makes this so extremely pleasant to look upon is the great breadth of open and well-kept green grass, and the simplicity of the design. How much more effective are these plain oblong beds when planted, and how much more easily and effectively can they be planted, than those narrow, sharp-pointed figures that look so pretty on paper! The great number of pillar Irish Yews placed at regular distances along the sides of the main walks, as represented by the little circles, also give the design a very distinct and rather elegant character. Along the balustrade walls numerous vases are placed, which were beautifully filled with Scarlet Pelargoniums and other flowers. Mr. Smith, in order to make the plants in the vases produce an immediate effect, adopts a practice which is worthy of being more generally known. It is this—tins are made to fit exactly into the interior of the vase, and are filled early in the season with plants, which are kept in-doors until established; consequently when put in their places the plants produce an immediate effect.

It will be understood that the design is on grass; c denotes gravel walks, which cut it up into squares; d represents a grass slope; E, vases; r, a sundial in the centre.

At the risk of being somewhat tedious, I shall attempt to give some idea of the admirable manner in which this garden was planted. Commencing at the portico, the oblong beds immediately in front and stretching round the extremity of the ground, measure about 30 feet by 15 feet. These have all a very neat, trim, and beautiful edging of *Cerastium tomentosum*. This cuts the connection, as Mr. Smith observed, between the

green foliage of the plants and the grass, and gives the beds a very dresy appearance, and a kind of uniform framework throughout, which tells well from the windows, the proper stand-point to judge from. These beds were all planted with a considerable degree of uniformity, and yet in excellent contrast with one another. After the *Cerastium* in each bed was a belt 2½ feet wide all round of some suitable plant; then the centres, 24 feet by 8, were planted with something else. For example—No. 20, which has its brother on the other side of the walk, was planted thus—after the *Cerastium*, a belt of *Lobelia speciosa*, dotted with plants of *Echeveria metallica*, then another thin line of *Cerastium*, and the centre Mrs. Pollock *Pelargonium*. This was very fine. No. 30 had for the centre *Pelargonium* Amy Hogg, one of the most pleasing and effective of all, and greatly admired in Ireland; then a belt of Mangles's Variegated, mixed with a few pink *Verbenas*, and the grey edging. No. 31, centre *Pelargonium* Madame Rudersdorff, a belt of Golden Chain, and the grey edge. No. 32, centre *Pelargonium* Cybister, and a belt of Flower of Spring, with the grey edging. From No. 33 to No. 41 the style of planting the beds was somewhat different. The centres were planted with one colour as in the others, the belt portion in oblique bands of colour at about the angle of 15° from the grass, so selected as to contrast well with each other. When the materials are well chosen as to colour, &c., and both grow of a uniform height, this looks well, otherwise it has a very untidy irregular appearance. One or two examples may suffice. Take No. 41.—Centre *Pelargonium* Excellent, then diagonal or oblique bands alternately of *Calceolaria Aurea floribunda* and *Iresine Herbistii*. This looked well, but *Calceolarias* being such "cattle" now, it is hardly safe to trust to them. No. 40.—Centre *Pelargonium* Christine, diagonal bands alternately of the silvery *Centaurea candidissima*, and a good variety of dark-leaved *Bet*; these contrasted admirably, and both colours harmonised well with the pink *Pelargoniums* in the centre. No. 36 had in the centre *Calceolaria amplexicaulis*, and diagonal bands of the dark-leaved *Pellia* and *Pelargonium* Lord Roxbury, with the grey edge of *Cerastium*, as in each of the others. No. 37.—The two extreme corner beds were planted with a few sub-tropical plants by way of trial, such as *Wigandia*, *Solanums*, *Cannas*, and *Custard-plant*. These, although they had grown pretty well, had but a shabby appearance; the situation is far too exposed for these plants. Glancing now at the centre, or at the centre of either side, where the beds form three concentric circles, there was a very pretty display, although not so pleasing on the whole as the other parts. Nos. 1 and 3 were planted thus—*Calceolaria amplexicaulis*, edged with *Pelargonium* Crystal Palace Scarlet. Nos. 2 and 4, *Governor*, edged with *Centaurea candidissima*, which was very effective. No. 5, *Indian Yellow*, edged with a light-coloured *Pansy*. No. 6, *Calceolaria* Prince of Orange, edged with *Calceolaria Aurea floribunda*. No. 7, *Pelargonium* Lady Constance Grosvenor, edged with *Flower of Spring*. No. 9, *Clipper*, edged with a yellow *Pansy*. In the outer circle, Nos. 17 and 25, *Verbena* Purple King, edged with *Cerastium tomentosum*; 18 and 26, *Pelargonium* Silver Nosegay, edged with *Iresine Herbistii*; and No. 22, *Pelargonium* Madame Barré, edged with *Centaurea candidissima compacta*, were only attractive. Several of the others were filled with such as *Pelargonium* Lady Collum edged with *Lady Plymouth*, and *Flower of Spring* edged with *Iresine Herbistii*, the plant which in Ireland takes the place of the *Colons Verschaffeltii*. In the vases, which were chiefly filled with *Pelargoniums*, *Governor* proved the most effective scarlet. This is a decided improvement on Pauch. Excellent is also very effective and suitable.

Such was the arrangement during the past summer, and it was a good one, doing Mr. Smith much credit. A great improvement might, however, be easily effected here, which would materially enhance the appearance, and that would be by the addition of a couple of fountains placed in the centre of the circular part. The appearance of water in a hot summer day, with the green grass and pretty flowers, has a most pleasing effect on the senses. Let us hope that some liberal Lord-Lieutenant may make the trial.

After these summer occupants have gone, the beds and vases are immediately filled with spring-flowering plants, such as edgings of *Cerastium* and *Silene pendula*, *Hyacinths*, *Crocuses*, *Myosotis dissitiflora*, *Calandrinia*, *Pansies*, *Wallflowers*, *Aubrietias*, *Narcissus poeticus*, *Tulips* of all shades, *Nemophilas*, *Saponaria calabrica*, and *Daisies*. On this part, however, it is not my purpose to dilate at present, but I hope to return to it on some future occasion. Judging by the splendid materials in preparation for next spring's display, I should say it will be

very fine. Mr. Smith informs me that the beds are already planted, so that I would advise all who may have the opportunity to pay the Vics-Regal Lodge a visit.

plant house having a three-ridged roof. This is used also for entertainments of various kinds. During the time of my visit it was filled with some fine plants of *Crotons*, and two large plants of *Cycas revoluta* and *circularis*. A little way off, again,

stands another house, a very useless and unmeaning structure, quite enough to try the temper of any gardener. As an aviary it might prove useful, but as a plant house never. Mr. Smith

has to grow great numbers of plants for decoration, and they are grown well. I observed great quantities of the *Euchais amazonica*, *Gardenias*, *Dracaenas*, *Allamandas*, &c.; also of the

Sugar-cane, which rather attracted my attention, as I had never seen it in such quantity. Mr. Smith informed me that he found it extremely useful and easily grown. Small plants in 48-sized pots look particularly graceful. In some other pits I noticed a few Orchids, the *Cypripediums* being good, also fine plants of *Alocasias*, *Cissus*, *Adiantum*, &c. One span-roofed pit contained a fine lot of Heaths, which I was well pleased to see, as these plants are such particular favourites. Azaleas were here also in great number and in excellent condition. Pelargoniums, of what are called the etage varieties, were extra good, plainly proving that Mr. Smith is an adept at plant-growing. At the Dublin Horticultural Show the Vice-Regal gardens must show the example, and it is done, many plants being grown for this especial purpose.

It is for fruits, however, and Grapes especially, that the Vice-Regal Lodge is chiefly famed, there being immense quantities of them required. In what is called the forcing garden there

is a range of houses 600 feet long, 450 feet of which contain grapes. It is divided into eight compartments. This is a noble one, having a sort of cruciform front, with a short path behind, forming a sort of three-quarter span, with a back wall about 9 feet high. These houses, or divisions, are all planted so as to produce a successional supply, No. 1 being the earliest and planted chiefly with Black Hamburgs, No. 2 and 3 with the same. From these the crop had been cut. The Vines appeared to be in fine condition. No. 4 was, again, Black Hamburgs. In this there was a splendid crop, over thirty bunches on each rod, and all well finished. No. 5 was a rather remarkable house, about 70 feet in length, the Vines treated on what is termed the extension system; three Vines—one at one end, and two at the other—being made to fill the entire house. The rods, seven in number, are trained lengthwise along the roof of the house until they meet in the centre, and right well they looked. The crop was something marvellous—

The Vice-Regal Lodge.

too heavy I fancied, yet the bunches seemed to "finish" well. Mr. Smith informed me that last season the crop was equally heavy, over 700 lbs. weight being cut. The roots of these Vines are all inside the house, and the health, the training, and the general appearance of the whole was very creditable. The next house, No. 6, was filled chiefly with late varieties, such as Alicante, Lady Downe's—the best of all late-keeping Grapes, Trentham Black, and Foster's White Seedling. The examples of this were excellent; it is, however, better suited for early than late work. No. 7 contained Muscats, the king of all Grapes. In No. 8 the Vines have only recently been planted. I observed a good many of Mrs. Pince's Black Muscat, a much over-rated Grape; a good keeper without doubt, and of fair flavour, but far from satisfactory as a cropper. This must give way to Madresfield Court Muscat, of which Mr. Smith had only one example. Royal Ascot was here also. This is a good and useful variety,

and well deserving of extended cultivation. The other variety in this house was Lady Downe's.

The Vice-Regal Lodge can boast of having one of the largest Pine stoves to be seen. It is a low ridge-and-furrow structure, 44 feet in length, 24 feet in width, and about 7 feet in height to the eaves of the ridges; these are seven in number. There is a broad walk leading through the centre, thus dividing the interior into two beds which are filled with tan. In this the plants, which are grown in pots, are plunged. The appearance of the house both externally and internally is rather pleasing. The broad path in the centre gives ample facility to view the plants, which can very seldom be done with Pines. Mr. Smith grows his Pines here in all stages—fruiting, succession, and suckers, and they all looked well, there being some very fair fruit. Mr. Smith spoke in high terms of the convenience in working such a house as this, and of its efficiency

generally. It is the only Pine stove he has, and many fine fruits are annually produced.

Into the other departments of this regal garden I shall not enter at present, further than to remark on the general excellence throughout. Peaches were grown well and abundantly; Pears, also; and cordon Apples were well represented. Vegetables commanded their share of attention, and were worthy of the place. In conclusion, I have to thank Mr. Smith, who has been for many years the gardener, for his exceeding kindness and hospitality.—B.

WORK FOR THE WEEK.

KITCHEN GARDEN.

LITTLE can be added to previous directions under this head. The operations of one week are but an epitome of what has been and still will be necessary for some weeks. It may be truly said that most of our operations at this season have no law as regards the time of performance, being entirely dependant on the state of the weather. Common sense will suggest to everyone desirous of excelling, that no opportunity should be allowed to slip by of getting the soil in a favourable state for the reception of the various crops which must soon be committed to it; and as the basis of success is allowed by all good practical gardeners to be a thorough system of drainage, no time should be lost in attending to this most material point. Whatever is done should be done well. I would never allow a drain to be laid down that was likely to become deranged in its operation, as the good that might otherwise be derived from it would be nullified from the difficulty of ascertaining where the defects were. As this kind of work may be done at any time when it is dry overhead, we shall do well to look to it in time. The surface soil must be occasionally stirred amongst *Cauliflowers*, *Lettuces*, and young *Cabbages*, and the latter should have the earth drawn round the stems to prevent them from being blown about by the wind. *Celery* and *Parsley* must be protected in severe frost. Let a warm patch of ground on a south border be prepared for a sowing of early *Radishes*, and in bad weather prepare a quantity of material for the protection of early crops of various kinds. These things must soon be put in requisition, and they ought to be at hand when wanted.

FRUIT GARDEN.

The renewing of fruit-tree borders where the soil is impoverished is a very necessary operation at this season; let as much of the old soil be removed as can be done without disturbing the roots, and its place be supplied with maiden loam; avoid using stimulants, which often induce over-luxuriant growth without a corresponding degree of fruitfulness. As a considerable difference of opinion exists on this point, young gardeners will do well to turn their attention to it. As far as my experience goes I hold it to be a fundamental point in the formation of borders for fruit trees that no stimulating manures should enter into their composition. I ought to add, however, that Vines are an exception, for they are gross feeders, and capable of assimilating a greater amount of nourishment than harder-wooded fruit trees. All the pruning, except of Figs and Apples, and most of the nailing of wall trees, as well as the training of a pollers, should be finished if possible by New Year's-day, and the same may be said of bush fruit. The making of borders or stations for fruit trees, too, should be autumn business. Wherever soil has to be introduced, September or October is the most fitting time, as the best of soils may be seriously injured by moving them in a wet state.

FLOWER GARDEN.

Protect tender plants, and in moderate weather, especially if dry, open the canopies or coverings a little for a few hours once a-week or so, in order to dispel damp. Do not, however, suffer the sun to shine on plants of this kind. In frosty weather a scheme of the masses or beds might be decided on, and the soil renewed according to the character of the plant. Little can be done now except in the way of preparation, and should frosty weather continue, it will afford every opportunity of having all the compost heaps thoroughly frozen. By repeatedly removing the encrusted surface, and piling it up every morning, many of the insects and their eggs will be destroyed—a point of no small importance to the cultivator. It will also be a good time to cart turf sods, peat, &c., and to lay by a good stock of soil most suitable for the various plants and flowers, without which it is next to impossible to grow them successfully. If leaden pegs are used for layering Carnations

(and these I should always recommend in preference to bracken or fern), a fresh stock may be cast and the old ones cleaned and straightened. If the florist can mend his own hand-lights and shades, they ought now to be attended to, and the metallic wire which has been used for attaching the stems of Carnations or Tulips to their supports, should be made ready for use and stored away in any place till the returning season brings it into request. Rabbits during the severe weather are apt to attack Carnations and Pinks. It would be worth while to try Mr. Rivers's plan of dipping small square pieces of cloth into brimstone, tying them to sticks, and inserting the sticks in the ground round the beds. Now is a good time to collect Rose stocks for another year's operations. In selecting these, discard the green-backed variety. Those stocks which were budded this season may now have the shoots cut back to within 6 inches of the buds. Buds of tender varieties should have a little moss tied round them for protection from frost. Sweep and roll grass lawns and gravel walks.

GREENHOUSE AND CONSERVATORY.

In pruning and training the climbers in the conservatory and other houses, some regard must be paid to the time when it is desirable the plants should bloom. Thus with stove climbers not required to flower before autumn, pruning may be deferred for some time; but for earlier display it should be done at once. Passion-flowers, Bignonias, and similar plants, which make long annual shoots, should only have their branches thinned and slightly shortened; while others, as *Convolvulus*, may be soursced-in. *Kennedya*s will soon be showing bloom, and what training they require should be done at once, but the pruning should not take place till after they have ceased flowering. Where Orange trees are grown to decorate the flower garden in summer, care should be taken to prevent their beginning to push previous to their removal to the open air, and this more especially if the trees are wintered in a dark-roofed house. When such happens the young leaves have always a thin, flabby appearance, and soon turn brown after the plants have been set out of doors, whereas if growth has been prevented till the trees are in the open air, the foliage will bear any amount of sunshine, and still look green and healthy. The introduction of the Chinese *Chrysanthemums* having caused a disarrangement of part of the stock, it becomes a matter of importance to rearrange matters, that groups or tribes may occupy situations according to their habits. But in keeping the conservatory gay with blooming plants, let the arrangement of the interior be occasionally changed by grouping the plants somewhat differently, and adding a few striking subjects, as some of the hardiest Palms, &c., for effect. *Chrysanthemums* decaying should be cut down, suffered to become somewhat dry, and removed to cold frames. Those who cannot afford frame room may secure them in some shed or outhouse for a few weeks, covering them overhead with clean straw whilst the frost lasts. If they are slightly frozen here it will not signify, only take care that they do not thaw too suddenly. Forcing pits will soon have to be kept in full activity to supply the various calls for plants in bloom, which, during winter, are more or less in demand in most establishments. Care should be taken before plants are moved to sitting-rooms to gradually harden them for a day or two, either by placing them in the conservatory or an intermediate house. Pay attention to the plants intended for successive blooming. Insects should be kept down, and every means afforded to keep the foliage clean and healthy. As, with the exception of forced plants, most other things are now in an inactive state, the temperature of the plant houses should fall to its minimum point, consistent with the safety of their various inmates.

STOVE.

Little can be said here at present. Use moderation in heat, ventilation, and atmospheric moisture. Beware of exciting the buds of *Orchids* before their time. Do this, and keep a somewhat drier atmosphere until the middle of January.—W. KEANE.

DOINGS OF THE LAST WEEK.

Gardening and Gardeners.—The gardeners of the olden times might well enjoy themselves in looking around them during the winter, as then they could take some compensation for their hard labour with hand and head when the days were long and the sun strong. The recollection of such scenes, and comparative liberty, combined with poetic dreams about the "loves of the flowers," and the pleasure of even in the humblest degree contributing to their loveliness, have induced many a youth to

enter the field of gardening to be deeply disappointed at finding that there is now no season of the year when there is anything like leisure time in a garden. Of course there may yet be genial and happy spots where gardening may be followed calmly and quietly, and where the imaginative and the poetical may be indulged in among all the digging, pruning, potting, fringing, &c.; but as a general fact it would be well for all dreamy youths, before taking to gardening, to be well indoctrinated with the idea that their case will be rather exceptional if, instead of the expected ease and quiet, they do not find that they must manage to put up with hard galloping from April to June, and pretty hard trotting every day in the year besides. Many gardeners will experience that they are rather amongst the fortunate ones if, from many extras put in their way in winter, they do not find themselves behind with their winter work when spring work ought to engage their attention.

We mention these matters more particularly because we have of late years been often sorry to see youths entering with high hopes on gardening as a means of living, and then leaving it, after wasting much time, because they found that the labour required from body and mind was too arduous for them, and that even holidays were few and far between. In all cases where numbers of youths are taken into gardens as apprentices, or improvers, or learners, it would be well to set before them stern realities, instead of allowing them to dream about flowery imaginings, as such youths, when disappointed so as to turn to other occupations, not only injure themselves, but keep the gardening market so overstocked, that those who have the natural capabilities, the requisite energy, and the determination to surmount all obstacles, find it all the more difficult to get on, or even to obtain suitable employment. Unfortunately, notwithstanding the vast increase in the number of gardens of late years, there has been a still greater increase in the numbers of those who aspire ultimately to manage them, and this is partly owing to the fact that many make a commencement in this direction who have never clearly calculated on the difficulties with which they must contend. These difficulties, as well as the pleasures, calmly looked at would induce many a youth to betake himself "to fields and pastures new," instead of even for a time throning that province of labour in which it is now so difficult to obtain remunerative employment.

It is sad to think at this inclement season of many gardeners willing to labour and unable to find employment; and it is equally melancholy to see so many youths and able-bodied men accustomed to country work, going from place to place in search of work for a day, or a week, with little in their pockets, and next to empty cupboards at home. Many country gentlemen who are able to afford it, would confer a great benefit in effecting contemplated improvements in ground work, grubbing, planting, &c., at such a season and in such circumstances; as almost any able-bodied man, though previously unused to it, can with a little supervision be made dexterously to wield a spade, or trundle a barrow. We would be inclined to look at such work in many cases as true charity, and charity dispensed in the best manner, so as not to rob the receiver of the wages of a true manly self-respect.

KITCHEN GARDEN.

A sharp frost on the 8th, and a fall of snow on the 9th, have confined our operations chiefly to wheeling, and to keeping lifted plants of Sea-kale, &c., under protection. The snow is one of our best protectors, and therefore for two days our cold pits protected a little have been left untouched. A dense fog on the 10th led us to hope for a change, but the wind veering to the north, and a rising barometer, may give us frost instead of thaw. Open weather would give much work, and help those who have little to do.

FRUIT GARDEN.

We filled several frames with Strawberry plants in pots, setting them on the surface with just a little bottom heat below them, as much is apt to injure them by encouraging mere growth.

On the 9th, as the snow covered the roof of the orchard house, we gathered the last of the Coe's Golden Drop Plum, and smoked the house with bruised laurel leaves. It is of little use smoking such a house unless the roof is covered, and snow is the best of all coverings for the purpose. The snow and the frost prevented our collecting tree leaves, but we carried home a good lot previously raked up. For all sorts of hotbeds such leaves are invaluable, as requiring little or no previous preparation. We never scruple using rank dung beneath if we can put a good surfacing, say 12 to 15 inches, of hot sweet leaves over it.

Fine-Apple plants in pits and frames heated by fermenting material, cannot now be too well banked-up to the wall-plates, or the tops of the frame. For this any sort of heating material will do, as the object is less to give bottom heat than to throw heat, and dry heat too, into the atmosphere of the pit. Where there is plenty of manure, great things may be done by surrounding a solid wall with such material; then there is no danger of rank steam. If atmospheric moisture is wanted in the shape of vapour, all that is required is just to sprinkle the wall inside gently. The best pit we ever tried for heating in this way had slabs of stout slate 1 inch thick and 3 feet wide inserted in the brickwork. From rank fiery dung we have had these slates so hot that we could scarcely touch them. The next best was a solid 4½-inch brick wall in cement, with 2-inch piers at every 4 feet. From that pit, 5 feet in width, we could always obtain heat enough for anything, but in the winter the moulds of fermenting material against the wall were anything rather than narrow and small. We put a strong lining the other day against the back wall of a pit with late Cucumbers, to help the hot water. Such heating by dung is, no doubt, old-fashioned, but much might be done in this way in many a farmyard where the heat given off by fermentation is lost.

Another point is apt to be overlooked by many new beginners in the management of either cold or heated brick pits, and that is that the walls of such pits are good radiators of heat, and therefore carry away much heat in winter. We have known glass so carefully covered that no frost could enter, but cold and frost penetrated by the walls. It was like shutting the door securely and leaving the window unfastened. Where such places are well heated, the fuel plentiful, and the expense never considered, the walls, though 1 or 2 feet in height at back, need not be much thought about; but when matters are the reverse, and every bushel of coal is an object, then the placing from half an inch to an inch of wheat straw neatly with strings and nails against such walls would be a great saving as respects keeping heat in. Straw is scarce this year, and as yet our cold pits and heated pits are still exposed, but even in heated pits when we covered the back wall we soon saved the value of the straw in the diminished consumption of the fuel. When people have proved such things by experience they will be led to gain a similar object with much less trouble by having not solid but hollow walls, the confined air acting as a non-conductor.

ORNAMENTAL DEPARTMENT.

Out of doors the frost and the snow have had it their own way, and there has been little done except in sweeping walks for locomotion and clearing off prunings, &c.—R. F.

TO CORRESPONDENTS.

Books (A. T.).—There is no book with merely lists of plants for small greenhouses and small stoves. We have frequently published such lists in this Journal. Refer to back numbers. "Eden's—'Allotment Farming for the Many'" will suit you. If you enclose five postage stamps with your address you can have it from our office free by post. (H. T. S.).—You can have "The Cottage Gardeners' Dictionary" free by post for 7s. 2d.

Sand from Glass Works (T. R.).—The sample you enclosed is equal to the delicate silver sand for potting purposes. There is little, if any, plant nourishment in such sands, and they are only used either to render the soil with which they are mixed porous, or to secure a dry surface.

Gas Stove (Anthony).—Apply to any gas-fitter. We know of no grass needed for the purpose you mention.

VIOLETS NOT FLOWERING (E. M. S.).—Their not doing well is a result of their not having a proper amount of air and light during the summer, and when they are allowed to grow into a thick, close mass the plants are weak, and suffer from dryness in summer. Watering with liquid manure would not now induce flowering, though it would assist the swelling of the buds. You are right, Violets ought to be raised every year; the runners being planted in May in beds of good rich soil, watered well in dry weather and kept free of weeds, &c. If the old plants are retained they should have the runners, and, to a certain extent, the suckers removed, encouraging them with copious waterings in dry weather, and top-dressings of rich soil or well-rotted manure.

KEEPING MICE FROM BULBS (Rev. C. H. P.).—We cannot say where this powder is to be had as a protection to bulbs from mice. A line of tin will keep them away so long as the tar is offensive in smell and soft and liquid. Copped furze is greatly detested by them, and so are rough, larly awns obtained after threshing. Trapping and poisoning are so far efficient when mice are not otherwise well led. On the whole, there is nothing like a cat for keeping a place free of mice. On a border a cat might have a house at each end, with a wire all the way, connected with a con string and short chain round her neck.

CUCUMBER LEAVES INJURED (A Young Gardener).—We found a few red spots, and traces of blight on the leaf of the Cucumber. For the first, the best remedy at this season is painting the heating material when not above 100°, with sulphur, also painting the walls and other surfaces, and giving slight syringings in sunny days. For the latter, smoke will do best. The treatment is all right, but light soil and little dung will be best in winter.

TREES FOR A BANK OF LOOSE CHALK (Crete).—The bank being covered with soil for planting the trees, we do not see why Beech should not grow. Larch we have seen doing well where, from the stony character of the ground, most other trees refuse to grow. We should try both; the Beech to remain and the other as nurslings.

VARIEGATED PINE APPLE FRUITING (W. S.).—It is not unusual for this to fruit. We have seen fruit of from 3 to 4 lbs. weight, and we have no doubt under good cultivation it might be grown to a greater weight.

PLANTS FOR GREENHOUSE DECORATION (H. S. C.).—Six *Asclepias*, Stella, Criterion, Extranei, Mrs. Duchesse Adelaide de Nassau, and *Gleditsia formosa*. Six *Shorea Patersoniana*: Archibishop, Charles Turner, Maid of Honour, Expectation, Congress, and Conquillor. Six *Ficus Patersoniana*: Belle of the Season, Fairy Gair, Pink of Perfection, Lady Dorothy Nevill, Neatness, and Brightness. Twelve *Zonal Patersoniana*: Advancer, Charming, Coleshill, Diamond, Display, Harmony, Landscape, Mahel, Parity, José, Hope, Herald, and Estacy. Six *Douglas Poinciana Patersoniana*: Conqueror, Marie Lemoine, Le Vesuve, Delight, Sparkhill Beauty, and Mignon.

VINERY-GREENHOUSE (S. H.).—We approve generally of the plan and arrangement of the house, but, if suitable otherwise, we would have had the flue under the front table platform instead of under the back stage. For the late house, where you will not put many plants until the fruit is out, we would have the following—two Bowwood Muscat, one Trebbiano, two Muscat of Alexandria, two Lady Dow's. For the intermediate house—one Golden Champion, two Muscat of Alexandria, one Muscat of Hamburg, two Black Hamburg, one Trencham Black. For the early house—two Black Hamburg, one Royal Muscadine, one Buckland's Sweetwater, or Dutch Sweetwater.

GROUND VINERY (Howard).—We are not quite sure if we understand you. Do you propose that your brick wall, 24 inches high and 24 inches wide, flat on the top, should, with ventilating bricks at top, form the back of a Rendle's ground vinery, with another wall in front? then there can be no question as to the success. But if you mean the flat top of this 24 inch wall to be the base of your vinery, then we should prefer a wooden frame with glass to stand on it, as the use of bricks for the side would occupy too much room. The bricks beneath would absorb and give out heat in summer. In such a shady soil we would see no use in bricking in a little pit for the Vine roots. Any fresh, sweet loamy soil would do, and if you added a fifteenth part of boiled bruised bones, the same of lime rubbish if the soil was not naturally light, and as much sweet rotten dung, the Vines would grow freely in it. For a Vine to cover from 9 to 12 feet in length, a root space a yard square and 24 inches deep would be ample at first, as you could give rich top-dressings every year, and when you thought it would do the Vines good you might add a little more space of soil afterwards. We think that a small hot-water pipe in such a place would take a good deal of trouble, and be so far a departure from simplicity. If carefully attended to it would be useful in dull weather when the fruit was setting, and in dull weather in autumn when the fruit and wood were ripening. Cast-iron gas-pipes, however, we should think would be cheaper than those made of wrought iron.

VINES FOR A SMALL HOUSE (H. C.).—Your house, 20 feet long and 12 feet wide, will hold ten Vines at 3 feet apart, the two end Vines being planted 15 inches from the ends, and the distance equally divided between the others. We have a house of the same length with twelve Vines, but we think them a little too close together, for though for the first two or three years they have plenty of room, yet when the rods are spurred the whole length there is too little space for the leaves being exposed to light and air. You do not say whether you have other houses, and wish this to afford an early, midseason, or late supply of Grapes; but we take it for granted that you have no other house specially set apart for Grape culture, and our selection is made accordingly, and is—one Black Champion, one Frankenthal, two Mill Hill Hamburg, one Buckland Sweetwater, one Foster's White Seedling, one White Frontman, one Black Alicante, two Muscat of Alexandria, and if you have twelve Vines—one Lady Down's and one Madras-Bird Court Black Muscat. With these varieties in one house you may have a supply of Grapes till after Christmas. We approve of your having the Vines planted inside, having the border partly in and partly outside the house.

DUST FROM STOVE FIREBRICK (Poplar).—The dust you complain of as settling on your plants from removing ashes, &c., may easily be avoided by damping the ashes before you remove them, and damping the firebox before you clean it out. If the plants are very dusty we would take them out, or to a shed, in a fine day, brush them carefully with a small hair broom, and then syringe and wash them, and when becoming dry replace them. This would be better than washing them in the house.

HEATING A GREENHOUSE (G. D. Garis).—We would much prefer 34 or 4-inch pipes for heating your greenhouse vinery to 6-inch pipes. The latter will, of course, hold heat longer, but they will be lower in being heated. For such a house 14 feet in width, 6 feet in front, 8 feet at back, and then a hip of glass to the ridge, two 4-inch pipes along the front would keep out frost, and enable you to have good late Grapes, and to keep them hanging late. To have early Grapes, say in June, you would require four pipes instead of two—that is, three flows and one return. The "Vine Manual," which you can have from our office for thirty-two postage stamps by post, will, we think, suit you.

ENDIVE BLANCHING (R. S.).—The objections to using sawdust for covering and blanching Endive are, first, the trouble of washing the sawdust off, and, secondly, the taste that in some cases might be communicated; otherwise the plan would answer well. There is nothing better for blanching than a tile, a slate, or a board laid flat on the Endive plants, but in severe weather the plants beneath might be injured. It is merely as protection that leaves of straw above the slates were spoken of. Anything that will keep the plants from light will do. Nothing does better than a dark cellar.

LARGE POTATO (T. P. Smith).—Three pounds and twelve ounces is a great weight for a single tuber, but you will see at page 350 one mentioned that weighed four pounds.

WIRES OF TRAILING BREAKING (Alpha).—We fear you have no alternative but to remove the small brass wires and replace them with others of galvanized iron, which is the best and most durable for out-door work. Copper wire is little better than brass; it corrodes, and soon becomes brittle. No. 10 galvanized iron wire is what we use. It answers admirably, and is strong without being unsightly.

OROBANCHE ON CISSUS DISCOLOR (Duckwing).—The parasite you enclosed is *Orobanche minor*. It was introduced probably in the soil employed for potting the *Cissus discolor*.

BOILER FOR GREENHOUSE HEATING (R. H. F.).—As you obtain such an abundance of heat, we would let well alone. The sudden cooling of your house may be owing to the quick cooling of the 40-foot flue and return of small pipes before they reach the larger pipes in the house, especially if these small pipes are exposed, or close to an absorbing, conducting medium. They should be placed in a wooden box packed with charcoal or dry sawdust. We have not worked it, but we have no doubt the tubular self-regulating boiler is good, though we take all these wondrous descriptions with a considerable reduction. More depends on the stoker than on the boiler. See what is said on the subject in page 466 of the present number, the use of the damper, &c. With the right use of the damper, practice will soon teach you how to avoid trouble at night, and yet maintain a somewhat regular temperature. When the house is at its proper temperature, slow combustion regulated by the damper and the ashpit-door, will keep a regular heat for a long time. Recollect that heating a dwelling-house is very different from heating a plant house, where the glass is exposed to every variation of temperature. In a case similar to yours, the small saddle boiler was so close to the bars there was not room for fuel. Under-pinning with a fire brick so as to make the furnace larger made all right.

SHADE FOR FLOWERS (A. G.).—The simplest and cheapest is this:—Fig 1 represents a piece of pasteboard (old hat-boxes will be quite as good), about 8 inches by 6, less or more. By bringing the two bottom corners together, so as to overlap a little, the pasteboard can be nailed

top and bottom to a thin lath of wood, as in fig. 2, which can be tied at the required height upon a tall flower-stick, which should be squared a little to make it set firm; or it may at once be tacked to the stick as shown in fig. 3. These shades will endure heavy rains if the pasteboard be moderately stiff, and will last several years. They have been used for Tulips, Ranunculuses, Carnations, Roses, Pinks, and Dahlias.

FUCHSIAS FOR STANDARDS (H. S. C.).—Avalanche, Beauty of Kent, Enchantress, Giant, King of the Stripes, and Troubadour.

AZALEA LEAVES FALLING (Julia).—We can only account for the leaves falling from its being their natural season to do so, or from their having been attacked by thrips, or from want of water in summer. The only preventive is to place the plants after flowering in a moist warm house, as a vinery at work, to make fresh growths, and, when these are formed, to keep the plants in a moist and warm atmosphere until the shoots begin to thicken at their points; then expose them fully to light and air, removing them to a cool airy house where they can have air day and night. The plants ought not to be allowed to suffer at any time from want of water, but they ought not to be watered whilst the soil is wet, yet water should be given before the soil becomes so dry as to cause the leaves to fall.

CAMELLIA BUDS FALLING (H. H. R.).—The principal cause of this is defective root action. It may be induced by a saturated and sour state of the soil, also defective drainage, but in your case we think it is caused by the regular waterings. Camellias ought not to be watered until the soil becomes dry, and then enough water should be given to show itself at the drainage. Pot them in spring in a compost of turf pared off a pasture or common where the soil is a light sandy loam, chopping it up small, using it fresh, and potting finally. We think they will not fall another season.

GRAPES SETTING (J. Mackenzie, M.D.).—All the Grapes you mention are good setters. We have never heard that Golden Champion does not set well. On the contrary, we believe it does; but the information you have received is correct, that the berries are in some cases attacked with a disease from which they decay prematurely.

HEDGE FOR MARKET GARDEN (Constant Reader).—Beech makes a very good hedge, but Hornbeam makes one thicker, and is the better of the two for a boundary, but we do not consider either of them formidable enough for a boundary fence. Holly and Thorn make the best of all. One Holly and five Thorns per yard will be required, and you may have a fence in three or four years that will turn anything, and from the growth of the Holly you will have a semi-evergreen fence second only for protection to Yew. We would not have the Poplars nor any kind of tree, unless it were a line or two of Austrian Pines, but for a market garden we consider hedges most suitable. Besides the boundary fence, we would divide the interior into quarters or plots by hedges of Beech and Hornbeam—that is, if the space is large; if but small, the boundary fence will

be sufficient. Trees are more injurious than beneficial, for their roots and branches waste too much ground. The best plan of breaking up the ground is to trench it as deeply as there is soil of a good staple, not bringing up too much of the poor stubborn subsoil. Trenching will cost more than, perhaps, any other mode of breaking up, but it will more than repay the first cost, and give a far better result than any other mode. Indeed, without deep cultivation the full value of the ground is not derived.

SOWING PELARGONIUM SEED (*A Subscriber*).—Sow the seed in pans or pots filled to within half an inch of the rim with light rich turfy loam, adding about a third of leaf soil and a sixth of silver sand. The pots or pans should be well drained, and the seeds scattered evenly and moderately thinly, just covering with very fine soil. Place the pots near the glass in a mild hotbed, and water gently and very carefully, and when the plants appear admit air freely. Sow in February or early in March. The main points to be attended to are free air-giving, keeping close to the glass, careful watering, but preserving the soil in a moist state, and keeping the seedlings from becoming drawn up. When they have made a rough leaf and show the second, pot off singly, and when again established remove them from the hotbed to a cold frame, hardening off, and either planting out or growing them in the greenhouse.

VINE BORDER MAKING—VINES FOR OUTSIDE BORDER (*Idem*).—The drainage of the border should be good. Nine inches to a foot of rubble will not be too much, and the bottom of the border should incline to the front, where there should be a drain to carry off the water. The border should be formed of turf taken from a pasture where the soil is a good light loam, prying it off not more than 3 or 4 inches deep. To every cut-load add two barrow-loads of lime rubbish from an old building, the older the better, and a barrow-load each of lumpy charcoal and bones broken and bruised rather small. The turf should be chopped into 3 or 4-inch squares, and the whole well mixed. Placing a layer of sods grass side downwards on the drainage, make the border of the above compost to the depth of 3 feet, and we would have it, if practicable, fully half above the surrounding ground level. For planting the Vines use a compost of two six-months old chopped small, adding a fourth of well-rotted manure and a sixth of half-inch bones. The best time to plant is early in March, just when the Vines are beginning to push or have started into growth. The kinds succeeding best in an outside border are Black Hamburg, Frankenthal, Mill Hill Hamburg, Trencham Black, Foster's White Seedling, Buckland Sweetwater, and Trovrien Frontignan. The Muscats and late-hanging kinds, requiring as they do fire heat for their successful ripening, are not, as a rule, suitable for outside planting.

FUNKIAS, SEEDLING CANNA, AND WIGANDIA TREATMENT (*H. S.*).—The Funkias should be kept moderately dry until they grow, the soil not, however, being kept dust-dry; when they commence growth water copiously. They are increased by division of the roots when the plants are beginning to grow. Keep them in a cold frame, pit, or cool house with abundance of air and light. They are, however, hardy. We think the cause of the seedling Wigandia losing their leaves now is their having a drier atmosphere than they were exposed to during the summer. Give no more water than enough to keep the leaves from flagging, and afford a light situation. Report in March, and being encouraged with an increase of temperature and moist atmosphere, they will start freely, making nice plants by May, when they should be hardened off, and planted out in June in warm sheltered situations. The seedling Cannas are all right. At this season the old stems die down, but the roots are alive. Keep the soil dry, or give very little water. They may remain in the pots during the winter, and in February or early in March shake them out, report them in fresh soil, and place them in a hotbed, watering carefully until they begin to grow, and when they have grown a foot or more height take a off. They are fine either for the greenhouse or sheltered spots in flower gardens.

NAMES OF FRUITS (*J. M.*).—No. 1, Beurre d'Arcambert; 2, Passy Colmar; 3, Easter Bourne; 4, Winter Cassano; 5, No Plus Morris. *(J. E. Rind)*.—Passy Colmar. (*J. B.*)—1, Triomphe de Joubert; 2, Gloire d'Orléans; 3, Swan's Egg; 4, Golden Water Pearmain; 5, Margil; 6, Hollandbury; 7, Golden Noble; 10, Northern Greening; 11, Hughes's Golden Pippin.

NAMES OF PLANTS (*T. H.*).—1, Blechnum bra-siliense; 2, Campylopusium phyllitidis; 3, Aspidium ciliatum; 4, Nephrolepis molle; 5, Pteris caudata Sieboldii, now Lactaria Sieboldii; 6, Cyrtidium Fortunii; 7, Selaginella Kraussiana (the *S. hortensis* of gardens); 8, Adiantum cucullatum; 9, Adiantum trapeziforme; 10, Adiantum macrophyllum; 11, Lycopodium vesperitidis, or Pteris incisa. (*Buell*).—1, Tradescantia vittata; 2, Begonia fuchsoides; 3, Mesembryanthemum, specific name next week. (*Lee*).—Your plant appears to be *Watsonia strictiflora*. (*J. B. Senebar*).—Your plant appears to be *Pentstemon baccharifolium*. (*H. B.*).—Both your plants are *Cineraria maritima*, also known as *Senebar cucuraria*, a common South-European plant, much used as an edging plant in gardens. (*A Subscriber, J. L.*).—Cultivated in gardens under the name of *Azteratum glaucum*, which name we believe to be spurious. (*G. B.*).—One is *Asplenium marinum*, the other a variety of *Lady Fern*, *Athyrium Filix-foemina*. (*J. W. Boyd*).—*Asplenium formosum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

GOLD-PENCILLED HAMBURGHS.

In your criticism of the Birmingham Show you draw attention to the fact that the hens in the Gold-pencilled classes seem to be fast losing colour. I deem this fact of so much importance—if we are to arrive at perfection in breeding this beautiful variety—that I crave a few lines to point out a remedy. A few years ago I paid a visit to Yorkshire, and experienced no difficulty in finding several beautifully pencilled hens with a rich ground colour, yet this year very few of these dark birds are to be found. A very successful breeder of Pencilled Hamburgs in the eastern counties writes me—“Have you another good pair of pullets to part with . . .

as I have been unfortunate in breeding them this season?” I get the same tale from Yorkshire, Lancashire, and Northumberland, and yet to my mind there is no variety of fowl so easy to breed as Gold-pencilled Hamburgs. If exhibitors will only adopt the advice given in our poultry books, they will experience no difficulty whatever.

Having been asked to contribute a few lines to your Journal on the result of my breeding experience, I do so in the hope that it may induce lovers of Hamburgs to exercise more care in the selection of their breeding stock. I attach more importance to the colour of the cock than to the colour of the hen, provided, of course, the hens are finely pencilled. This season I bred with two hens, a pullet, and a three-year-old cock with a bronze tail. The result was very indifferent pullets, well pencilled, but very light. With the same hens and a dark-tailed cock—in fact, I should say a green-tailed cock, I bred pullets three or four shades deeper in colour, and this I am persuaded is no accident. Season after season I have bred pullets an exact *fac simile* of the hens I have bred from, in pencilling, ground colour, and comb, but I have invariably found that the depth of ground colour in the pullets was in proportion to the depth of colour in the male bird.—FRED. PENNIX, *Whitmead House, Ashley Vale, Bristol*.

ARMOUR-PLATED POULTRY BASKETS.

When will the cares and troubles of poultry exhibitors cease? It is now just four years ago that my old Light Brahma cock Sampson, well-known to many of your readers, closed his victorious career so tragically, being killed on his way to a show by the bite of a dog. History is said to repeat itself. Last week my first-prize Birmingham cock, also a winner of many prizes, returned home, having narrowly escaped old Sampson's fate. His basket was torn and shattered, his feathers lay in considerable numbers on the floor of it; two wounds, the larger about the size of a thumb-nail, most fortunately not deep, were visible under the feathers on his back. Altogether, the bird looked much the worse for the fright and the shock to his system. Restoratives in the shape of bread and ale, and a few hours' rest, improved his appearance considerably, but, although well enough to go to the Crystal Palace, he certainly did not exhibit his “Birmingham form,” and his first prize at the last-named show degenerated into a simple commendation at the Palace.

I think your readers will agree with me that so narrow an escape from a great catastrophe, even assuming no worse thing to happen, is not a pleasant possibility for an exhibitor to contemplate every time that dogs and poultry are fellow travellers to or from a show.

I may add that mine is not a solitary case, as another exhibitor tells me of a similar accident on the very same occasion. What, then, is the remedy? One expedient has occurred to me, which I mention for the sake of its being possibly useful to other exhibitors. I have commenced the construction of some “iron-clads” or “armour-plated” baskets. In other words, I have told my blacksmith to fix inside two or three baskets intended to carry my most precious specimens, when liable to canine danger, a lining of perforated zinc or tin, with apertures sufficient for breathing purposes, thus protecting the sides and bottom of the basket from hostile teeth, and rendering its occupant as philosophical as the poet of our infancy, when he said—

“Let dogs delight
To bark and bite.”

—JOHN PALES.

LA FLECHE FOWLS AT THE BIRMINGHAM SHOW.

In the account of the Birmingham Show, in your paper of Thursday, December 1st, the following paragraph occurs relating to my La Fleche hens which took first and second prizes:—“The hens were in better order, but the second prize was a manifest error, being half-bred with Minorcas. This was evident all over, the birds having Spanish bodies, red faces, and one an actually flapping comb.” I should be much obliged if you would contradict this statement, as it is calculated to do me serious injury. The birds referred to I bred at Westworth myself from others also bred by me the previous year; and I have never had either Spanish or Minorcas in my possession, nor have any of my La Fleche ever been crossed

with any other kind of fowl.—W. C. W. FITZWILLIAM, *Wentworth Woodhouse, Rotherham.*

THE BIRMINGHAM POULTRY SHOW.

THE yearly show at Bingley Hall has now passed through more than three generations. It is at that ticklish age for some part of creation that is described by being between twenty and thirty. As it gets older it increases its claims upon us, and shows more and more it is carrying out the purpose for which it was started. Those who assisted at the beginning will recollect how a sort of apology was considered necessary, and it was therefore put forth that its object was the improvement of the breeds of domestic poultry. Had there been another—the introduction of new breeds, it would have been attained. The improvement has been an increase of weight, till Ducks now weigh nearly as much as Geese did formerly, Geese half as much again as they did, Turkeys as much as some of the smaller quadrupeds, and fowls as much as hen Turkeys. It has introduced Brahmas, Creve-Coeurs, Houdans, La Flèche. It has made Game Bantams. It has formed, as it were, a table that can be depended upon, showing the fowls that are fit for certain soils, that are calculated to satisfy the requirements of certain amateurs. It describes those that thrive in close confinement, or require the run of a farmyard. It has shown that poultry may be a profitable adjunct to the stock of the agriculturist, and a pleasing relaxation to the professional man, while it is also self-supporting.

Those who have the management and ordering of this great Show have no cause to complain of the public; they have been well supplied, and they deserve it. Many years ago a pen was composed of a cock and three hens or pullets. It was said that only those who had large stocks could pick out four birds good enough for exhibition. The pen was then altered by a cock and two hens. It was next said if anyone wanted to buy a cock he was obliged to buy two hens at the same time. Then a class was introduced for cocks only. This was a success—so great, indeed, that now all the classes are altered, and buyers may secure either a cock, or two pullets, or two hens. Then it was objected that there was trickery in claiming the most profitable pens on the opening day. It was necessary to squeeze, and almost to fight, for two or three hours to ask for a pen, and find it already sold. The owner of a very good bird rewarded with a first prize, who had been so doubtful of its merits that he only named a small sum, at which it was immediately obtained, sold and resold four or five times till it had ten times the sum originally put upon it, is now sold by auction at midday, and the owner gets all the advantage of it. These are only some of the endeavours made by the intelligent and hard-working Council and Committee to deserve the support they receive.

I will now take a review of the different classes, making, in going on, such remarks as may suggest themselves.

Two hundred and ninety-four pens of *Dorkings*; almost a show in themselves. Many of our old names were among the exhibitors and prizetakers, and many new ones, some distinguished for the first time. I can no longer note an increase in weight. It is, perhaps, unreasonable to expect that every year should produce heavier birds than its predecessor. Where would they stop? This year the prize cocks weighed from 10 to 12 lbs., and hens and pullets from 8 to 10 lbs. each. The weight that was the desideratum some years since is now so much of a fact it calls for no particular comment. But it must not be supposed I am frating the classes to "faint praise." Seventy-three pens were named in the prize and commended list.

Three hundred and twenty-two entries of *Cochin-Chans*, sixty-nine of them named honourably by the Judges. I cannot speak too highly of these birds; the offer by amateurs of four silver cups and the same number of extra prizes of 25 each, may have had to do with the beautiful display these classes afforded. Mrs. White's adult cock, and Mr. Augustus Taylor's bird of 1870, were most perfect specimens of the breed, and reminded me of Mr. Tomlinson's celebrated bird some years since. If I were to speak critically of these classes I should place the Buff first, the White second, and the Game last. There were perfect hens and pullets of the first—positively perfect. The Whites were excellent, many of them having but one drawback—the vulture hook. I should place the Game last; they have size and symmetry, but many of the hens and pullets are too yellow in their plumage.

Indian Pouter, a comparatively recent introduction, brought two hundred and sixty pens of noble birds. Two silver cups, extra prizes, belonged to these classes. One went to a beautiful bird of the year, shown by Lady Gaydyr; the other, for two pullets, went to the Hon. Mrs. Baillie Hamilton. I cannot speak too highly of many of the birds that competed in these classes. Mrs. Hunt's birds were beautiful; the Hon. Miss Douglas Pennant sent excellent specimens. In some of the pens vulture hooks cast away prizes, and in some of the hens there was a buff tinge that is not desirable. The Light variety now forms large classes, and supplies beautiful birds. Mr. Pate (the father of the classes) of course took one first prize, but the silver cup was taken by Mr. Cook. Another first prize was taken by an old exhibitor, Mr. Richard Rollard. A great success was achieved by Mr. W. Sampson, of the United States, who took prizes for cock and hens. I hope this is only the beginning of competition on the part of our transatlantic friends. I can speak very highly of all these and many others.

Spanish were very well represented, but with the exception of some few pens they were hardly so good as I have seen. I was glad to miss some of those monstrosities with cauliflower faces and closed eyes. There were not wanting beautiful specimens of both sexes.

The *Game* fowls were represented by three hundred and seventy-four pens. These, if alone, would have constituted a show, and the number of good birds shown make it impossible to attempt anything like a mention of all that deserved it. I can speak favourably of all the prize and commended birds, more especially the Black and Brown Reds. The Duckwings are among the weak classes, and I missed the splendid bird I saw years ago. The Silver Duckwings seem to be almost lost. I am sorry for it, for I knew no handsomer birds.

Bantams have suffered a revolution of late years. Of one hundred and seventy-three pens, no less than one hundred and sixteen were contributed by the Game. The beautiful Sebrights only brought thirteen pens; many of the birds were highly meritorious, and if pens could have been made irrespective of ownership, perfection would have been the result. In the varieties I greatly admire the Pekin, or, as I call them, Cochin Bantams. If the Japanese increase but a little in numbers they must have a class. The Game, especially the cocks, were very good, and formed a most attractive class. I must, nevertheless, offer one suggestion to exhibitors, which is to select birds with wings close up to their bodies. However meritorious the drooping wing may be in a Sebright, it is a serious fault in a Game Bantam.

The points of *Aylesbury Ducks* are so well known, that I shall content myself with giving the weights of the successful. Of the four prize pens the first weighed 18 lbs. 9 ozs., the fourth 18 lbs. 4 ozs. There was an unexampled show of *Rouens* of seventy-two pens. Not only were the prizetakers faultless in colour, but they were heavier than the *Aylesbury*. The first-prize pen weighed 19 lbs. 1 oz.

The *White Game* held their own. The first-prize pair weighed 56 lbs. 12 ozs., the second 56 lbs. 5 ozs.; the goslings of this year 49 lbs. 4 ozs., and 49 lbs.

The first-prize adult *Turkey* cock weighed 36 lbs. 4 ozs., the second 35 lbs. 2 ozs. Both the prizes for cocks of 1870 went to Mr. Lythall, the birds weighing 24 lbs. 6 ozs. and 23 lbs. 12 ozs. The old prize hens weighed 35 lbs. and 34 lbs.; the young ones 31 lbs. and 29 lbs. I most heartily congratulate Mr. W. Simpson on his success; he beat all competitors with a bird that came across the Atlantic to compete.

I deserves mention, and should speak a trumpet-tongued warning to exhibitors, that many of the best birds were passed over because they were timmed. Had those birds not been tampered with they would have taken prizes.—VIVANT.

TRIMMING PIGEONS.

"Y. B. A. Z." complains of gross cases of trimming (I presume in poultry), and makes use of the following sentence:—"It is, however, certain that the usual washing and cleaning of some birds before exhibition makes it very difficult to draw a distinction between the removal of a soiled, half-broken, or injured feather, which I imagine all of us would consider admissible, and the removal of a blemish, or the painting over such a spot. I should much like to learn whether any exhibitor does consider this illegitimate." As a Pigeon-fancier, breeder, and exhibitor for the pure love of the thing, you will, perhaps, permit me to express the decided opinion, that to trim a Pigeon for the show pen, or before sending it on approbation, is nothing else but—a swindle. Judges have been swindled by it, and so have exhibitors and purchasers; some of them myself among the number, innumerable times. Not long since I bought a Red Jacobin cock at a good price from a man in Yorkshire, who boasts that he writes against trimming in a certain journal, and I did so only upon having a sight of the bird, which appeared to me to be a perfect beauty, and without a foul feather. Imagine my surprise when in one month every third feather on his head was red. I kicked up a row about it—of course I did—when this fancier, known to every reader of "our Journal," coolly told me that he had only had the bird for two days, and it it was trimmed he, a protector against trimming, was not responsible for it; and when I told him that the bird was not worth sixpence to me, he coolly offered me a shilling for it. I suspected some other fancier might get the bargain and repent it, so I pulled the bird's neck; but I think I was swindled, and I object to be swindled. Upon another occasion I purchased a pair of Black-headed Nuns from a gentleman fancier, who honestly told me they required a *little* trimming. I wished to have them because I knew that he had taken seven first prizes, and I paid for them accordingly. The seller said rightly they only required a little trimming, because the cock had only one black feather on his breast, and the hen two between her shoulders. I lent them four times to fanciers, who saw nothing wrong in extracting these three feathers, and the birds always brought the first prize. I showed them nine times with the three foul feathers where Nature placed them, and they never brought me even honourable mention, with the exception of once at Kilmarnock, when they

were placed "first" by Mr. Hale against birds which had beaten them fourteen days before. One of the shows to which I went them was held at the place from which I write, and they were beaten by a pair of birds pure as the driven snow at the show, but when they were ten days in the loft of a gentleman who claimed them, they had a strong likeness to a Silver-spangled Hamburgh.

Well, sir, as I would not dress, I sold, and these birds are now the property of a fancier who considers them the best pair of Nuns in the world. I never knew them beaten except when I had them, and they were as good then as ever they were or can be. I state these facts as my experience of trimming, and I would say it is a disgusting practice.

I would suggest that the prospectors of our shows should not only contain a prohibition against trimming and painting, but that where the judges find out that birds have been doctored, they should be empowered to confiscate the whole pen, and in cases of strong suspicion keep possession of the birds for a reasonable time to make certain. Unless some strong measure like this be adopted, true lovers of Columbia will keep their pets at home rather than be quaked out of their due by those who trim or employ professional bird-stuffers to do it for them. Perhaps you do not believe there are men who live by trimming birds for other people by the job; if so, you are mistaken, because I know one loft where, before every show of importance, there is to be found a professional man, who comes expressly to dress exhibition birds, and is well paid for it. He can insert as well as extract, blacken, whiten, and roll on, or do almost anything an ill bird requires to make it look a good one, and he does it well. It is not honest, however, and I uphold that to pull out a feather is the same as to put one in—that is, it is—a swindle.—E. M. B.

KILMARNOCK ORNITHOLOGICAL SOCIETY'S SHOW.

The nineteenth Exhibition of this Society was held in the Corn Exchange Hall and Bazaar Market, Kilmarnock, on the 29th of November, and was more successful than any previous show. The entries for poultry numbered 521; the Pigeons 211; the Canaries, Males, Goldfinches, and other birds, 202, nearly all of which came forward, there being very few empty pens.

Spanish (16 pens), was decidedly above the average. The first prize went to a pair of fine birds, the cock also winning the silver medal offered as a special prize to the best cock or cockerel in the class. The second prize pen contained a very superior cock, but the hen was scarcely equal to him. Miss Crawford exhibited a very superior single cock shown for the medal, and Mr. Stuart's commended pen contained a most excellent hen but badly matched. Dressing the faces in this class obviously did not disqualify, as certain of the winning birds were most beautifully done. We, however, think it would be fairer to the general body of exhibitors if judges could either rigidly disqualify all such birds, or sometimes state in their schedules that removing hairs from the face and feathers to the furthest limit of the white would be admitted.

Pouter (15 pens), were a fair class. The first-prize pair were large and well matched, the cock being a little deficient in comb. He would, however, have easily secured the tinopiece offered for the best cock or cockerel in this class, but was unfortunately not entered for it. The third-prize pair were most excellent Silver-Groys, this cock being awarded the tinopiece.

Brahmas or Cochins (18 pens). Thirteen Brahmas and five Cochins; but notwithstanding the disparity in numbers the Cochins succeeded in carrying off the bulk of the honours, securing first, third, and fourth, and a commendation, while the Brahmas had to be content with a second prize and high commendation. The Brahma cock in the second-prize pen was probably the best bird in the class, but matched with a hen good in colour and marking, yet not too small.

Scottish Geys.—This, although somewhat a hard breed, did not muster more than fifteen pens, of which the first and second-prize pens were remarkably fine specimens. The second-prize cock had as finely a marked tail as we ever saw, being entirely free from either black or white feathers. He was, however, deficient in size and shape as compared to the first-prize bird, which also gained the tinopiece for the best cock or cockerel in this and the preceding class.

For the benefit of English fanciers we may here state that this class of birds are coloured exactly like Cuckoo Dorkings, and are, indeed, esteemed the more the nearer they approach the Dorking type in everything but the number of toes, five being at present a disqualification. We think it would be much better to admit the five toes, and as the colour has long been, and still is, the favourite one amongst Scottish bantam fowls, to call them by the name of Scottish Dorkings.

Gold-spangled Hamburgs (23 pens), eight or nine of them being worthy of first honours at any show. The breed is evidently strong in this neighbourhood, as another local exhibitor secured the second prize, the third being won by Mr. Will with a splendid cock, but the hen very slightly deficient in marking.

Silver-spangled Hamburgs (23 pens), the class being decidedly superior to what it has ever been in former years. The first-prize cock was also awarded the tinopiece offered to the best cock of the Silver-spangled or Silver-pencilled classes.

Gold-top *Black Red* (21 pens), were a very superior class. We believe the equal of the first-prize hen has rarely been seen, and we have no doubt that she will score a few more prizes for her worthy owner.

White-spangled Hamburgs (12 pens).—In the first prize pen the cock was first-rate in head, tail, and style, and, had his comb not been slightly tinged with yellow, the tinopiece offered between the cocks of this class and the Silver-spangled must have gone to this bird.

Reducks.—Of these there were only three pens.

Game fowls (25 pens), the Brown Reds securing the whole of the prizes, being superior in shape to those of the other colours. The first-prize cock was in shape and style a perfect model of a Game fowl, but was slightly deficient in colour. He was, however, awarded the tinopiece offered for the best cock amongst the Polish, Game, and any variety classes.

Blue *Bantams* (22 pens).—The tinopiece offered for the best cock or cockerel in this class was won by an excellent Black Red, but he was matched with a hen so inferior in colour and in general condition that the pen was not the prize intended in the prospectus. The first prize was awarded to Mr. R. B. and the second and third. We observed the cockerel in this pen had the comb white, but he was only sold, and he was scarcely in good enough condition to be so. We think the position of the type as would have been never so good.

Black and White Pouter.—The first prize was awarded to a very small pair of Blacks, excellent in colour and style, the cock also winning the tinopiece for the best cock or cockerel. The second prize went to Blacks inferior in colour to the first, and the third to very excellent Whites, which in the opinion of our parties should have been awarded the second prize.

Bantams of any other variety (10 pens), were mostly S. Whites. The first prize and silver medal for the best pair in the class were awarded to a pair of G. B. S. undoubtedly superior to anything else. If we mist do not, they were those which were first of Johnstone show a fortnight before, where they also attracted considerable attention. The second prize was awarded to Silvers, the third to Golden, and the fourth to Scotch Geys, which latter should be fast-birds of the breed, but of the same name, but we fancy we have seen better specimens.

Black-spangled Hamburgs.—The first and second prizes were awarded to Grey Chans, and the third and fourth to Black Hamburgs.

White Pouter (12 pens), excellent in quality. **White Ducks** (12 pens).

Black and white cocked (5 pens).—The Judge in this class was evidently inclined to encourage the useful more than the ornamental. Gills were first, Black East India second, then very third, and the beautiful Carolina only fourth and highly commended.

TIGONES.

On entering the Hall the first birds that met our view were **Old Dutch** *any colour*.—The first-prize pair (Blue) were fine birds, good length of feather and comb, the hen rather grey by arching. This pair of birds also carried the special prize for the class. The second-prize pair were well matched in colour and marking, though not equal in style to the former pair. Third prize, a pair of R. B. the cock in particular a very fine bird in splendid show. This class as a whole was good.

Bantams bred in 1870 (any colour).—A very good class, some pairs not well matched, but in every of the birds, particularly the cocks, showed great promise. The length of feather seemed to prevail, that of limb rather deficient.

Carriers (any colour).—This was the finest class of Carriers ever shown at this competition, and we have seldom seen a finer out of a city show. The first-prize pair were really grand birds; they also carried off the tinopiece (special prize). The second-prize pair were also fine, and the third prize was taken by a Kilmarnock breeder.

Game fowls bred in 1870.—A very fine class. Some of these birds were in point of form and elegance complete, both Blacks and Duns. Mr. W. Massey, who carried off the first prize in the old class, was also first in this. The two classes of Carriers were certainly the finest in the Show, besides those the largest.

Shrike-fowl *Taube* were a very good class. The first prize went to Alm onds, very fine though poor in colour. This pair ought to have also carried off the special prize, but, as they were not entered for it, the special fell to the second-prize pair, also Alm onds. In this class were a pair of very fine Kites and good Black Mittles.

Buffs.—A good class. A pair of Yellows took the first prize, and a pair of pretty Reds the second. Several pairs were ill-matched.

Reducks were a large and fine class. Excepting a pair of Black Saddlebacks all were pure Whites. The first-prize pair were splendid, the second and third very fine, and numerous pens contained fine specimens of both sexes handsly matched.

Jacobins.—A poor class. This breed does not seem to improve anywhere.

Turkeys were a good class. The first-prize pair seemed to have been birds lately imported. There were a number of pretty sweet-looking birds and well-marked, but, as at most shows now-a-days, too many having the skull crown instead of the pointed or turn crown.

Trumpeters.—An excellent class. The first prize went to a splendid pair of Mottles. The Whites were the only birds that fell short. We have seldom seen so many fine Trumpeters entered by so many different exhibitors. With two exceptions the crest, rose, and feet were up to the standard.

Nuns formed a good class; they looked well at the Show, being not only well marked but very clean.

Common Tumbler.—A pretty and varied class—Baldheads, Beards, Mottles, Sells, and a very pretty pair of the Blue-barred breed neat and small. We also saw in the Committee-rooms a very neat pair of Reds showing their tumbling properties to an intending purchaser, the hen in particular doing it clean and cleverly when called upon.

Common Pigeons.—A great array of strong handsome birds, and a great array of youthful fanciers trying to discover the difference between the successful and unsuccessful birds.

English Owls.—A pretty class. The first-prize bird was a good sample of what the Owl should be.

Any other distinct variety.—Not a large class, but containing a great variety. A pair of White African Owls carried off the first prize.

CANARIES, &c.

The prizes in this department were offered only to Scotch Fancy, which is most emphatically what Mr. Blakston calls it, "the bird of Scotland." In the eyes of Scotch fanciers it is the most elegant and graceful Canary in existence; and when we see Englishmen describing them as being nothing but bad Belgians, we generally have an attack of bile for a day or two. We see our revenge, however, as they are evidently invading the south, and we have little doubt will before long supersede some present favourites. We would, however, warn southern fanciers not to let them do what they have done in the north—viz., extinguish all the others, with the exception of Belgians. We are sorry to see of late years a disposition in Scotch fanciers to breed nearer to the Belgian than they used to do, particularly in the shoulder. The true Scotch Fancy shoulder should be shaped like a cone cut in two from the apex to its base, entirely free from the squareness seen in the Belgian; but in the award of the timepiece for the best clear bird in the Show we observed the winning bird (Mr. Conn's first-prize Buff cock) had the shoulder, if not so high as a Belgian's, at least decidedly of the characteristic shape. We should like to see prizes offered at this Show for Belgians also, which we think would have the effect of keeping breeders nearer to the genuine type, as the characteristics of both breeds would then become more generally known.

In Yellow cocks there were many excellent and true-bred birds, the first and second being very good. The Yellow and Buff winning hens were also very superior birds; and amongst the Pigeons were many beautiful evenly-marked birds quite up to the standard shape. In the Mule classes everything was cast into the shade by Mr. Gray's Yellow-marked bird; it was a perfect show in itself, so large and beautifully coloured; and in the Goldfinch class Mr. Conn's first-prize bird was equally conspicuous.

In the class for the best home or foreign bird only three Parrots went in appearance, though more were entered. The first prize went to a Green bird in the most perfect condition we ever recollect of having seen a Parrot. It could not have been smoother although cut out of solid marble. The second prize went to a nice light-coloured Grey.

We believe that in all the classes the judging gave very general satisfaction.

- SPANISH.—1 and Medal, A. Walker, Kilmarnock. 2 and 1/2, A. Robertson, T. Waddell, Kilmarnock. 3, J. Blair, Kilmarnock. 4, J. Dick, c. A. Stuart, Kilmarnock.
PENGUINS.—1 and 1/2, A. J. Mutter, Kilmarnock. 2, Z. H. Heys, Barrow, 1/2 and Timepiece, J. Gray, Airdrie. 3, G. F. Lyon, R.N., Kirkcubright. c. T. Seabrook, Kilmarnock.
CHINA BANTAMS OR COCHINS-CHINA.—1, G. Girdwood, Ayr (Cochins). 2, A. Robertson (Black). 3, J. P. Leck, Paisley. 4, J. Cochran, Kilmarnock. 5, A. Robertson (Black). 6, J. P. Leck, Paisley. 7, J. Gray (Cochins). 8, H. Fenton, Kilmarnock (Cochins and Redhead). 9, J. Gray (Cochins).
SCOTCH GREYS.—1, 2, and Timepiece, J. McKinnon, Hamilton. 3, R. Blair, 1/2 T. Wallace, Leamington. 4, A. Grant, Kilmarnock. c. J. Fulton, Bath.
HAMBURGERS.—Golden-splashed.—1 and Timepiece, J. Jardine, Kilmarnock. 2, A. Fritchen, 3, J. W. Will, Barrow. 4 and 1/2, R. Mackie, Kilmarnock. Silver-splashed.—1 and Timepiece, D. Gilman, Kilmarnock. 2, P. Mackie, 3, J. W. Will, Barrow. 4, J. Jardine, Kilmarnock. 5, D. Stewart, c. H. Pickles, jun.; 6, W. Mitchell, Golden-pencilled.—1, 2, and Medal, E. Crawford, Kilmarnock. 3, J. M. Campbell, New Byth. 4, W. Bachop, Stonefield, Linsay. 5, W. Nelson, Johnstone. c. J. Aitken, Girvan; J. Howe, Paisley. Silver-pencilled.—1, H. Pickles, jun., Barrow. 2, F. C. Haworth, Newfield, Haddington. 3, W. Bachop. 4 and 1/2, R. Blair, c. J. Platt, Dean near Bolton.
POLANDS (Tuppel).—1, H. Pickles, jun., 2, J. Partington, 3, J. W. Will, Barrow.—1 and Timepiece, J. McLaughlin, Paisley. 2, J. Barrow, jun., Pradley Field, Kendal. 3, Waddell, Airdrie. 4, R. Aronckie, 1/2 R. W. Will; Z. H. Heys, c. W. Young, Dalwhinnie.
GAME BANTAMS.—Timepiece, A. Gibb, Ayr. 1, Z. H. Heys, 2, Bellingham and Gill, Woodfield, Ayr. 3, J. W. Will. 4, W. Copland, Ayr. 5, T. Barker, Hill End, Burnley. c. J. Robertson, jun.
BANTAMS.—Black or White.—1 and Timepiece, J. W. Will (Black). 2, H. Pickles, jun. (Black). 3, S. & R. Ashton (White). 4, A. Mitchell, Paisley (Black). 5, H. L. Horne (White). 6, Drake (Black). c. H. L. Horne. Any other Variety.—1, and Medal, J. Crawford. 2, Miss F. C. Frew, Kirkcaldy (Silver-laced). 3, J. G. Orr, Beith (Gold-laced). 4, Mrs. Maxwell, Galston.
ANY OTHER DISTINCT BREED.—1, B. M. Knox, Riverside, Kilmorie (Crest-Crest). 2, Mrs. Hood, Greenbank, Ayr (Crest-Crest). 3, J. Fulton (Black Hamburgs). 4, J. P. Fawcett (Black Hamburgs). 5, G. F. Lyon, R.N. (Doulans). c. J. J. Maddow, Blythswood (Crest-Crest).
GREYS.—1 and Timepiece, J. Robertson. 2, W. G. Kerr, 3, J. W. Will. 4, W. Young, 5, A. Robertson. 6, J. Scott. 7, A. Gray. 8, J. W. Will. 9, W. Young. 10, A. Robertson. 11, W. B. Park. 12, J. Walker. 13, W. Conkey, Darvel. c. A. West, Wortsburn, Parady. Any other Variety.—1 and 1/2, J. Robertson (Call and Cardinal). 2, F. E. Scheffell, Morpeth (Black East India). 3, G. F. Lyon, R.N. (Muscovy). 4, S. & R. Ashton, Mottram (Cardinal). c. J. Dickie.
SELLING CLASSES.—1, W. Walker, 2, W. Jardine (Golden-spangled Hamburgs). 3, W. A. Orr (Golden-pencilled Hamburgs). 4, A. J. Mutter, Kil-

marock (Rouen Ducks); G. F. Lyon, R.N. (Brahmas); J. Sharp, Johnst. (Spanish).

PIGEONS.

- FOURNS.—Old.—1 and Timepiece, J. Butler, Glasgow. 2 and 1/2, J. Miller, 3, W. Archer, Kilmarnock. 4, G. Mann, Kilmarnock. c. J. Brown, Wishaw. Young.—1 and 1/2, J. Mitchell. 2 and c. J. Miller, Glasgow. 3, R. Aronckie, Parthen, Glasgow. 4, B. Donalson, Crosshouse.
CARVERS.—Old.—1 and Timepiece, W. Massey, Spalling. 2, H. Yardley, Birmingham. 3, J. Kerr. 4, M'Gill Skinner. 5, A. Wardrop, Kilmarnock. c. J. Guthrie, Hexham. Young.—1, W. Massey. 2 and 1/2, W. H. Mitchell. 3, A. Brown. 4, G. Brown; D. Munn. c. D. Lawrie, Kilmarnock. G. White.
TUMBLERS (short-faced).—1, J. Paton. 2 and Timepiece, J. Butler. 3, T. Deuch. c. J. Guthrie, Hexham. 4, J. Mair. c. H. Yardley.
DOVES.—1, H. Yardley. 2 and 3, White. 4, Miss E. M. Beveridge, Ayr.
FRANTS.—1, 2, and Timepiece, T. Wilson, Stewarton. 3, J. Kerr. 1/2, J. Sharp. 4, J. Galt, Kilmorie. c. W. Anderson, jun., Glasgow.
JACOONS.—1, J. Jardine, New Cumnock. 2, G. White, Ladyburn, Paisley. 3, R. Thompson, Beith. 4, A. Richmond, Kilmarnock.
TEMPERS.—1, Miss F. C. Frew. 2, R. Gibson, Kilmarnock. 3, W. McKindlay, Edinburgh. 4, R. Thompson.
TURKISH.—1 and 1/2, J. Hawley, Bingley. 2, G. Steele. 4, G. White. 5, Miss E. M. Beveridge. c. J. Sharp.
NUSS.—1, J. Reid, Darvel. 2, W. McKinnay, 3 and c. G. Gilchrist, Darvel. 4, Master A. Frew, Kirkcaldy. 5, J. Mair, jun., Kilmarnock.
TUMBLERS (Common).—1, Miss E. M. Beveridge. 2, W. McKinnay, 3, R. Blair. 4, Miss J. Weir, Kilmarnock. 5, T. Hawley. c. H. Craig; J. Guthrie, Hexham; J. Thomson, Kilmarnock.
COMMON.—1, J. Mair. 2, J. Lamont, Kilwinning. 3, W. H. Mitchell. 4 and 1/2, W. McKinnay. c. J. McKinnay, Dalry.
OWLS (English).—1 and 1/2, J. Mair. 3, T. Douglas.
DOVES (Ringed or Turtled).—1, A. Wardrop. 2, J. Seonlar. 3, J. Dunlop.
ANY OTHER VARIETY.—1 and c. J. Sharp (White Owls and Ice Pigeons). 2, H. Yardley. 3, R. Thompson. 4, Miss E. A. Knott (Archangel). 5, G. B. Phillips, Ayr (Yellow Magpies).
SELLING CLASS.—1, W. Demar, Crosshouse (Pouters). 2, J. Galt. 3, J. G. Orr (Owls).

CANARIES, &c.

- YELLOW.—Cocks.—1, R. Houston, Kilmorie. 2, A. Kelley, Paisley. 3, A. Miller. 4, B. Bony, Overton. 5, W. Grievy, Kilmarnock. c. D. Holter, Irvine. Hens.—1, E. Cron. 2 and 1/2, R. Calderwood. 3, J. Calderwood. 4, R. Crawford, Kilmarnock. c. E. Bunting, Kilmarnock.
BUFF.—Cocks.—1 and Timepiece, J. Conn, Irvine. 2, R. Calderwood. 3, J. Calderwood. 4, J. Kerr. 5, J. Wilson. c. J. W. Will. Hens.—1 and 2, R. Calderwood. 3, R. Crawford. 1, J. Gray, Airdrie. 4, J. Calderwood, Kilmarnock.
PENGUIN (Yellow).—Cocks.—1, A. Miller. 2, A. Stewart. 3, J. Glasgow. 4, W. Mair. 5, C. Aird, Kilmarnock. c. A. Lyon. Hens.—1, A. Kelly. 2, D. Hobbs. 3, J. Gray. 4, A. Crawford. 5, J. Wilson, Beith. c. J. Seoular, Kilmarnock.
PENGUIN (Black).—Cocks.—1, T. Scott, Carlisle. 2, J. Calderwood. 3, J. Norris, Ayr. 4, A. Brown. 5, A. Robertson, Galston. c. J. Gray. Hens.—1 and Timepiece, A. Crawford. 2, J. Glasgow. 3, A. Borland, Galston. 4, J. W. Will. 5, c. A. Stewart.
GOULDEN MITRES.—Yellow.—1, J. Gray. 2, G. Bryden, Newton, Ayr. 3, G. Bryden. 4, 1 and 3, G. Gordon, St. Quivox, Ayr. 2, J. Gray.
GOULDEN MITRES.—1 and 2, T. Conn. 2, A. T. Kilmock.
HOME OR FOREIGN BIRDS.—1, W. Brown. 2, E. Mitchell. 3, J. Richmond.
JACOONS.—Mr. John Paul, Glasgow, judged the Spanish, Dutch, and Scotch Greys; Mr. Robert Caldwell, Kilmarnock, the Game and Bantam classes; and Mr. Alex. Paterson, Airdrie, the Polands, Variety, Duck, and Selling classes. Messrs. James Hmie, Glasgow, and George Ure, Dundee, judged all the Pigeons; and Messrs. George Masterton, Robert Paterson, John Kelly, and Alex. Brown, the Canaries, Mules, Goldfinches, &c.

EDINBURGH POULTRY SHOW.

This was held in connection with an exhibition of cattle and sheep, on the 7th and 8th inst. The following awards were made:—

- SPANISH.—Cochins.—1, A. Ridpath. 2, Mrs. Gillison. 3, J. Gray; Mrs. Gillison. c. W. Paterson. Mrs. Gillison. Fulls.—1, A. Uppich. 2, W. Paterson. 3, R. Somerville. D. Gellatly. Cocks.—1, A. Shepherd. 2, W. Paterson. 3, A. Ridpath. c. J. Gray. Hens.—1, A. Ridpath. 2, and 3, R. Somerville. 4, A. Shepherd.
DOLANS (Coloured).—Cochins.—1 Mrs. A. Bruce. 2, J. Anderson. 3, A. Bruce, jun. 4, R. Bond. 5, R. Bond. Mrs. Gillison. Fulls.—1, Mrs. Morrison. 2, A. B. Bruce, jun. 3, H. L. McDonald. 4, J. Anderson. D. Gellatly. Cocks.—1, W. Paterson. 2, D. Gellatly. 3, J. W. Will. Hens.—1, A. Bazaar. 2, J. Anderson. 3, H. L. McDonald. 4, H. R. Bond. Silver.—Cochins.—1, D. Young. 2, W. Gibb. 3, Lady G. G. Montaguery. 4, G. Buchanan. D. Annan. Fulls.—1, Lady G. G. Montaguery. 2, W. M. G. 3, J. Curror. 4, H. Pinner. c. Mrs. Balfour. Duke of Buccleuch. Cocks.—1, Duke of Buccleuch. 2, J. W. Will. 3, J. Gibson. Hens.—1, D. Annan. 2, Lady G. G. Montaguery. 3, Miss Swain.
COCHINS.—Cochins.—1 and Cup, E. Leech. 2, J. Cowman. 3, E. Leech. 4, H. Paterson. Fulls.—1, C. Siggwick. 2, Mrs. Oswald. 3, E. Fearn. c. F. Leech. Cocks.—1, J. Sichel. 2, C. Siggwick. 3, E. Fearn. 4, J. Gray. Hens.—1, J. Sichel. 2, C. Siggwick. 3, E. Leech. 4, E. Fearn. c. J. Cowman.
BRAHMA POOTRA.—Cocherels.—1, R. Brownlie. 2, Mr. Gillison. 3, J. Riddell; J. A. Dempster; Miss Morrison; — Gillison. Fulls.—1, T. Rainis. 2, J. Cowman. 3, W. J. Holdsworth; D. Annan; W. R. Park; J. R. Dale. c. A. Simpson. Cocks.—1, Mrs. Gillison. 2, J. Sichel. 3, W. Swann; Mrs. Gillison; J. W. Will. Hens.—1, E. Leech. 2, G. A. Stephens. 3, W. Smith; R. Brownlie. c. N. J. Killyer.
GAME (Black-breasted or other Ducks).—Cocherels.—1, C. Jamieson. 2, J. H. Wilson. 3, A. Shephard. 4, W. McThuma; J. Carlisle; Mrs. Harley; J. W. Will. c. D. Harde. Fulls.—1, Mrs. Harley. 2, Mrs. Jamieson. 3, A. S. Brewster; R. Stewart; Mrs. Harley. Cocks.—1, J. W. Will. 2, W. Meldrum. 3, Henderson and Allan; D. Harde; J. H. Wilson. Hens.—1, J. W. Will. 2, Henderson and Allan. 3, A. S. Brewster; Mrs. Harley. c. B. Stewart.
GAME (Any other Variety).—Cocherels.—1, Mrs. Harley. 2, J. Logan. 3, B. Charwick; J. Anderson. Fulls.—1, J. Elder. 2, and 3, Mrs. Harley. Cocks.—1, J. W. Will. 2, Mrs. Harley. 3, B. Black. Hens.—1, H. Goodall. 2, Mrs. Harley.
HAMBURGERS (Spangled).—Cocks.—1 and Cup, J. W. Will. 2, D. Forrester. 3, J. F. Loversidge; J. B. Cranston; Miss Brown; J. Watson; J. Logan. Hens.—1 and 2, J. W. Will. 3, W. Harpark; D. Cheyne; J. Logan.
HAMBURGERS (Pencilled).—Cocks.—1 and 2, J. W. Will. 3, M. Forrest; W. Balfour. 4, Cheyne; J. M. Harvey. Hens.—1, W. B. Park. 2, and 3, J. Walker. 4, H. Pickles, jun.; J. M. Harvey; J. W. Will; J. M. Forrest.
BANTAMS (Game).—Cocks.—1 and Cup, W. Grieve. 2, W. Scott. 3, D. White-law. 4, G. Gibb. W. Gibb; J. Gray; R. Brownlie. c. J. Waddell. Hens.—1, G. Dowie. 2, T. Rames. 3, A. Gibb; E. Fearn; J. Harvey; W. Scott; H. Goodall. 4, R. Brownlie. c. J. M. Campbell.
BANTAMS (Any other Variety).—Cocks.—1, Miss B. F. Frew. 2, J. W. Will.

he, J. Ferny; G. Allan; S. & R. Ashton; J. Archibald; e. T. Watson. *Hens*.—1, S. & E. Ashton; 2, W. Gibb; 3, Bliss B. P. Frew.
Spaniards.—1, W. Gibb; 2, D. Wadde.
ANY OTHER BREEDS.—1, C. Siderwick (Black Hamburg). 2, J. Sichel (Creve-Coeur). *he*, G. A. Stephens; W. B. Park; W. Bockpark; H. Pickles.
Ducks.—*Any other variety*.—1 and Cup, E. Leech. 2, J. Scott. *Bantams*.—1, E. Leech. 2, D. Harde. *Any other variety*.—1, C. N. Baker. 2, T. Clarkson.
SEVERAL CLASSES.—*Cocks*.—1, A. Williamson (Cochin). 2, W. Paterson (Spanish). *Ties*.—1, A. Bowie. 2, W. Shirton.
TURKEYS.—1, J. Wilson. 2, Ducks of Baclench. *Bouls*.—1, E. Leech. 2, Duke of Buccleuch.
Geese.—1, E. Leech. 2, D. Harde.
JUDGES.—Mr. R. Teebay, Fulwood, Preston; and Mr. D. Brown, Verth.

BERWICK AND BORDER ORNITHOLOGICAL ASSOCIATION'S SHOW.

The Berwick and Border Ornithological Association, which was formed this year, held its first annual exhibition of British and Foreign Cage and Song Birds in the Corn Exchange on the 7th and 8th inst. Altogether there were 208 of the feathered tribe. The prize list is as follows:—

BULLDOGS.—*Clear Yellow*.—1, G. Norris, Berwick. 2, J. Baxter, Newcastle. 3, J. G. Chris. 4, Berwick. 5, J. Baxter; 6, Norris (this would have been a double if the second prize had for an accident destroying the plumage). *e*, R. Hall, Bedford. *Clear Buff*.—1, J. Thompson, Tweedmouth. 2, G. Norris. 3, C. Lugton, Hillman. *Any other variety*.—1, G. Norris. 2, J. Thompson. 3, S. Bunting, Derby. *he*, G. J. Barnsby; R. Hall; J. B. Gilchrist. *e*, J. Oxyton. 4, W. Scott. *Blue*.—1, R. Hall. 2, G. Norris. 3, R. Gresham. 4, J. A. Scott. *Red*.—1, R. Burnett. *Clear Buff*.—1, C. Lugton. 2, D. Allen. 3, J. Spidding, Stockbridge, N.B. *he*, R. Forsyth; W. Young. *e*, S. Robinson, Berwick. *The Cock*.—1 and 2, Allen. 3, W. Young. *he*, T. Dippie. *Norwich*.—*Clear Junco*.—1, G. J. Barnsby, Derby. 2 and 3, Moore and Wynne, Northampton. *he*, S. Bunting; Wallace & Beloe, Berwick; W. Young. *Clear Buff*.—1 and 2, G. J. Barnsby. 3, S. Bunting. *he*, R. Hayman, Middleburgh. *S. Bunting*; Moore & Wynne (2); W. Young. *he*, W. Young. *e*, R. Hall, Moor. *Norwich*.—*Evenly-marked Yellow*.—1, S. Bunting. 2, Wallace & Beloe. 3, Moore & Wynne. *he*, R. Hayman; E. Mills. *he*, Wallace & Beloe (3); Moore & Wynne. *e*, J. Baxter. *Evenly-marked Buff*.—1 and 2, Moore & Wynne. 3, W. Young. *he*, E. Mills, Sunderland; Wallace & Beloe. *he*, Wallace and Beloe (4). *Norwich*.—*Unevenly-marked Junco*.—1, G. J. Barnsby. 2, S. Bunting. 3, W. Young. *he*, R. Hayman. 4, R. Hall. *Unevenly-marked Buff*.—1 and 2, J. Barnsby. 3, R. Hayman. 3, S. Bunting. *he*, G. Green, Lothian; Wallace and Beloe (2). *e*, Wallace & Beloe. *Norwich* (Clear Junco or Buff, with Crest).—1, Moore & Wynne. 2, S. T. Jones, Northampton. 3, Wallace & Beloe. *he*, Wallace & Beloe; W. Clarkson, York; G. Shiel, Sunderland. *Norwich* (Clear Junco or Buff, with Dark Grey, or Clear Crest).—1, Cup, and Mr. E. L. Wallace & Beloe. 2, G. J. Barnsby. 3, Moore & Wynne. 4, Moore & Wynne; W. Young (2); G. Shiel. *he*, Wallace & Beloe (3). *e*, W. Johnson, Berwick. *CINCINNATI*.—1, Moore & Wynne. 2, S. T. Jones. 3, Wallace & Beloe. *he*, Wallace & Beloe; S. T. Jones. 4, S. Bunting; G. Shiel. *Buff*. 1 and 3, Moore and Wynne. 2, Wallace & Beloe. *he*, Master G. Wallace; Wallace & Beloe. *CINCINNATI* (variegated Yellow or Buff).—1 and 2, S. T. Jones. 2 and 4, Wallace and Beloe. 3, Moore & Wynne. *e*, D. Allan; Stevens & Burton. *ANY OTHER VARIETY*.—1 and 2, Stevens & Burton. 3, S. T. Jones. *he*, R. Hayman; Fairclough & Howe, Wallace & Beloe; W. Young. *he*, G. J. Barnsby; W. L. Miller (2); E. Mills. *GREENFINCH MOLE*.—*Marked or Variegated Yellow*.—1, J. Baxter. 2, Stevens and Burton. 3, G. Shiel. *e*, G. Thompson. *Marked or Variegated Buff*.—1 and 2, G. Shiel. 3, Fairclough & Howe. *he*, J. Baxter, Newcastle (2); W. & C. Barnston, Middleburgh; G. Shiel. *he*, S. Bunting. *Duck*.—1 and 2, Moore and Wynne. 3, Stevens & Burton. *he*, G. H. Ellis, Ashford, Bedfordshire. *e*, J. B. Bower, Berwick. *he*, W. L. Miller, Berwick; R. Faxon, Bedford. *GOLDEN PHEASANT*.—1, J. Baxter. 2, Fairclough & Howe, Middleburgh. *he*, S. Bunting; Stevens & Burton. *he*, W. & C. Barnston. *e*, J. B. Gilchrist. *GERMAN BIRD* (Any other variety).—1, G. Shiel. 2, W. & C. Barnston. *he*, J. Baxter, Newcastle; T. Robertson, Berwick; Fairclough & Howe; W. Grey, Berwick. *FOREIGN BIRDS* (Any variety).—2, Capt. T. Williams, Coldstream. *he*, W. and C. Barnston.

DISTRICT PRIZES.

Yellow or Buff (Any breed).—1, J. G. Nisbett, Berwick. 2, W. Allan, Berwick. 3, W. Gibson, Berwick. *he*, T. A. Glaston, Berwick; J. Giegze. 2, W. Leck. 1, Grey, Berwick; J. Purves, Berwick. *e*, W. Head-smith, Berwick. *ANY OTHER BREED* (Any breed).—1, J. G. Nisbett. 2, J. Lindsay, Berwick. 3, J. Gilchrist. *he*, W. Gilchrist. *e*, J. Giegze; T. Robertson (2); J. Lindsay; 4, Fairclough, Tweedmouth.

The Judge was Mr. Robert Pearson, Durham.

DORKING POULTRY SHOW.

This was held on the 8th inst. The following are the awards:—

DORKINGS.—*Coloured*.—1, M. Putney, Dorking. 2, L. Patton, Hillmore, Tinton. 3, Rev. J. D. Hoysted, Bradenstoke. *he*, F. May, Reigate. *e*, Ivery and Son, Dorking. *Chickens*.—1, Ivery & Son. 2, G. Cubitt, Dorking. 3, J. Smith, Southwark Park, Peterborough. *he*, G. H. Ellis, Ashford, Bedfordshire. *e*, L. Patton; W. B. Boxall. *Cockerels*.—1, J. Smith. 2, M. Putney. 3, G. Hine, Westcott. *he*, Ivery & Son. 4, Rev. M. Idee. *Pullets*.—1, G. W. Greenhill, Ashford. 2, H. Humphry, Ashtington. 3, W. E. Boxall. *he*, E. May. *e*, G. Ellis.

OPEN TO MEMBERS.

DORKINGS.—*Coloured*.—1, W. Fell, Westcott. 2, Ivery & Son. 3, M. Putney. 4, E. T. Bennett, Betchworth. *he*, D. B. Green, Brockham Court. *Chickens*.—1, Ivery & Son. 2, G. Hine. 3, W. Fell. 4, M. Putney. *he*, Z. Greenfield. 5, F. May. *Cock*.—1, Ivery & Son. 2, W. Fell. *he*, G. Hine. *Cockerel*.—1, Ivery & Son. 2, W. Fell. *he*, Rev. H. J. Cummins, Enfield. *he*, M. Putney. *Hens*.—1, M. Putney. *e*, W. L. Green. *he*, W. Fell. *e*, E. T. Bennett. *Pullets*.—1, W. Fell. 2 and 3, G. Hine. *he*, Ivery & Son. *DORKINGS*.—*Blue-speckled*.—1, Mrs. Mayo, Dorking. 2, W. Ducks.—*Aylesbury*.—1, W. F. Watson. 2, J. B. Nichols, Dorking. 3, J. M. Putney. *he*, D. B. Green. *Any other variety*.—1, Ivery & Son. 2, J. B. Corbet. 3, G. Cubitt.
Geese.—1, W. Messenger, Womersley. 2, W. F. Watson. *Chickens*.—1 and *he*, W. Attlee. 2, W. Messenger.
TURKEYS.—1, W. Messenger. 2, W. F. Watson. *he*, D. Christie. *e*, W. J. Evelyn.
JUDGES.—Mr. John Wood and Mr. Jenkins.

YORK POULTRY, PIGEON, AND RABBIT SHOW.

This Show opened to the public on the 6th inst., and was by far the best Exhibition, regarding both numbers and quality, held in the ancient city. The receipts were much larger than in any former year.

The following shows the number of entries at each of seven years' exhibitions:—

Year.	Poultry.	Rabbits.	Pigeons.	Year.	Poultry.	Rabbits.	Pigeons.
1861	255	5	276	1870	344	69	183
1862	312	58	314	1869	334	69	187
1863	278	65	259	1870	344	124	183
1867	276	65	124				

Dockings held the post of honour, and were, indeed, worthy, being seventeen pens, all good, with a splendid pen of Mr. White's first. There were one or two cockerels with the spur outside, and some hens with very bad claws. Exhibitors should keep such at home. Only one pen of a full *Spanish* came before the Judges, but they would, no doubt, have held their own against a very much larger field. Of young *Spanish* there were six pens, of which four obtained notice; it was a beautiful class. *Cochins* mustered twenty-two pens. There were several very neatly-winged cocks; and in *Buffs*, with the exception of the prize pens, they were far from being up to the standard. The *Partridge-coloured* were very superior to them in all points. Only one pen of very inferior *Whites* were shown. *Brahmas* occupied sixteen pens, old and young competing together. The first-prize pen was very fine, the cock, if anything, coarse in the head and not good in comb, but his partner was everything that could be wished for, in size, depth of colour, &c. There were several white-tailed brown-feathered cocks shown with vulture hocks nicely drawn. *Guns* filled forty pens in four classes, and were quite a treat to the lovers of those birds. Of *Hamburghs*, there were forty-five pens in four classes. The Gold-pencilled were only a moderate lot, with the exception of the prize pens. Being in the darkest corner of the Show, also in three tiers, one after the other, they were very difficult to see; neither Judges nor exhibitors had a fair chance. Hollow combs and very mossy hens abounded. The Silver-pencilled, with the exception of the first-prize pen, which had a beautiful-tailed cock and fine-marked hen, were poor, the difficulty being to award three prizes amongst them. The Spangled birds were decidedly better, and the prize pens left little to find fault with. *Polish* occupied ten pens, the Gold-spangled being the best. The *Game Bantams* mustered forty-four pens, but were, like the Gold-pencilled *Hamburghs* mentioned above, in a dark corner and four tiers, one over the other, and it being a dark day, great difficulty was experienced to obtain a sight of them. Where so many were good it was difficult to choose the best, but the first-prize cock was a beauty, and carried himself in true *Game* style; too many in this class betraying their Bantam origin by their drooping wings, &c. Of *Laced Bantams* there were only two entries, which were both good. In *Bantams* of any colour eight entries were made; the first and second going to *Blacks*. The hen in the first prize pen was a little gem, but the cock in the second-prize pen more stylish. In the "Any other variety" class were seventeen entries. *Black Hamburghs* took the first, and *Sultans* the second prize, with *Houdans*, *Creve-Coeurs*, and *Malays* in the order of merit. This was a fine class, one or two good pens arriving too late. Of *Turkeys*, the old birds weighed 44 lbs., and the young ones 36 lbs. In *he*, the Rev. G. Huxter had it all his own way, his first-prize pen of *Whites* weighing 54 lbs.; while the second-prize pen of Mr. Leech's only gave 194 lbs. when they came to the scales. Mr. Huxter may be proud of having won on the same day a double victory at the Crystal Palace and York with such splendid birds. The *Aylesbury Ducks* occupied fifteen pens. The first-prize birds weighed 16 lbs., and the second 154 lbs.; both being very good in bills and plumage. Of *Rouens* there were nineteen pens; 16 lbs. the weight of the first, and 15 lbs. of the second-prize birds. They were very fine in shape, colour, and bill. In the "Any variety" class were six pens. *Black East Indians* were first, and *Brown Cal Ducks* second.

As at the Crystal Palace, so at York, the "Selling class" was, perhaps, the most remarkable in the Show, and abounded with fine specimens of different varieties, which we were glad to see marked "sold" in large numbers. Fifty-five entries, *Dorkings* taking first, *Brahmas* second, *Cochins* third prizes; but it is a pity not to have a separate class for *Ducks*, *Geese*, and *Turkeys*, for with only three prizes in a class the Judges could not fairly please themselves; they gave a very high commendation to *Black East Indian Ducks*, with a high commendation to *Aylesbury*, and sixteen commendations in this the best class in the Show.

RABBITS.

NEVER, perhaps, before in this country was collected together for exhibition so numerous or valuable a stock of Rabbits, six distinct varieties being well represented, and amongst some of them the best specimens in the country. It really was difficult to determine which most to admire—the sedate yet graceful *Lop-eared*; the showy and

founded in the cells, and afterwards quickened by the influence of the drone?

This method of fertilisation was long believed by apiarians to have been "established beyond all contradiction," by the observations of M. Deuran, of Cambridge. It was not till Huber exposed the optical illusion which misled, that the bee world learned they had been accepting as true a conclusion which was altogether untenable. The processes that are now so much in vogue, though somewhat modified, were found in the hands of M. de Réaumur and Huber to be wholly without result. "We have," says the latter, "frequently confined virgin queens with drones of all ages. We have done so at every season, and witnessed all their advances and solicitations towards the males. Nothing, indeed, was left undone by him that was deemed likely to bring about a marriage in confinement, but without a fertile result.

Now, if the procedure adopted by the honey bees is at all similar to that followed by the wild species (and I have no doubt it is), the union of the sexes must necessarily take place on the wing in the open air. I had an excellent view of the conjunction of the *Bombus terrestris*, male and female, on the 18th of September, 1857.

In these cases where fertilisation has been supposed to have been effected when the queen was confined, I would like to ask whether all due precautions have been used to prevent its having taken place in any other situation. When we obtain a seemingly pure offspring after a pure Ligurian queen has been shut up with pure Ligurian drones, we are not to take this as a proof of the royal marriage having been contracted when in durance. It is very difficult to say when a pure breed has been secured.

I had a queen this summer, the daughter of one hybridised last year, which produced the finest-looking Italians. Not a cross was to be seen amongst them, and some half dozen young queens reared naturally after swarming were all beautifully marked. Yet all these queens which were put at the head of colonies, became mothers of a dark race with scarcely a trace of Italian features either in shape, size, or colour.—R. S.

OUR LETTER BOX.

BRECON POULTRY SHOW.—Mr. Brien has explained to us that the non-payment of prizes has not been his fault. After the 22nd inst. he will be enabled to pay them.

GAME BANTAMS MUTILATED AT THE DUBLIN SHOW (E. C. H.).—Our correspondent complains that the cock's sickle feathers were cut off and the tail otherwise injured. The mutilation was done previous to the judging, and he warns other exhibitors there to "look sharp."

EGG-EATING HENS (Constant Subscriber).—You can only watch the hens and drive them from their nests as soon as they have laid. It is sometimes useful to lay hard eggs about, so hard as to defy all efforts to peck pieces off.

HOBDAVS' TOPS (J. S.).—One too turning up and the other downwards is not a disqualification.

HAMBURGERS (S. D. C.).—We do not care for the colour of a Hamburger cock's eye. We cannot advise you about breeding, as we do not see the birds. If the son has produced part of your requirements, but you wish for more, use him again, not with his mother but his sister—with his mother he will merely produce again that which he produced before. A fellow in the comb is a disadvantage. A tail should not be too much bronzed, but it is a venial fault. We know nobody's indoligencies in poultry judging. You had better write to the judge in question. A hen with a pencilled tail is more likely to breed pencilled-tailed pullets than one with a blacking-brush tail.

POULTRY FEEDING (Hunt Henwife).—Your feeding is troublesome, expensive, and poor. We do not like either Indian meal, sharps, or buckwheat. They all go to make internal fat, and to prevent laying. Give them ground oats every morning, kitchen scraps, and Indian corn mid-day, and ground oats in the evening. It is bad crossing sitters and non-sitters, or we would advise Dorkings.

HASTENING LAYING (R. H.).—Your Dorkings are hardly arrived at an age to lay. Have patience. Grooves, meat, and hempseed will force them, but you will be a loser in the end. There is a great outcry for eggs; we hope those who have them will stand out for a great price, and that the present will make us wiser in futurity, and less dependant on a foreign supply.

COCKEREL FOR EXHIBITION (T. F. A.).—Allow him one pullet. Feed as we advise. If the shows are near at hand put him by himself; not, however, if other hens are about. If he can see them, it is better to allow him one pullet, or he may lose weight. Feed as we advise.

HENS APPARENTLY EGG-BOUND (M. H.).—The symptoms you describe are those of an egg-bound hen, but as there has been no egg, it is probably only a derangement which Billy's spilla, following on castor-oil, should cure. The cure will not be perfect till the evacuations are partly white. Give up the oats which they will not eat, and the potatoes which are worse than not doing, making internal fat, and causing diseased livers. Substitute ground oats. When twelve hens die at about the same time, it is fair to suppose they pick up something poisonous.

TERRITS (T. A. B.).—Put your Black cock with a Black hen, not a Red one. We do not crossing Blacks with Red's years ago, and the produce was always Strawberry, both colours being entirely spoiled. Point crows are best for Turkeys.

CARRIERS (E. Laurie).—It is usual with Carrier fanciers to match Blacks and Duns together, the idea being that a more brilliant black is the result. The fineness of plumage you allude to results most probably from the owner of the birds being able to fly them. Another thing producing fine colour and appearance is not exhibiting birds; they are injured by travelling. At the Peristeric Meeting, the birds exhibited by gentlemen members who do not show for prizes are far superior in appearance as to colour and gloss, to the poor birds that have been sent to shows all over the country. As to food, beans and old tares are the best for all Pigeons.

CRYSTAL PALACE POULTRY SHOW.—Through an error in the catalogue of the Crystal Palace Show we reported that Mr. E. Tindman took the first prize for an old Partridge Cochon cock and hen, whereas the first prize was awarded to pen 157, belonging to Mr. Linwood, Creeting, Suffolk. Mr. H. Slumach says his pen, 823, of Black Red Game Bantam pullets was awarded the second prize. Mr. Lorimer informs us that he took the second prize in class 111 (Pigeons, any other variety) with a pair of Pouterrels. We are informed that in the class for Black Ducks a fourth prize was awarded to pen No. 1178, belonging to Mr. G. S. Sainsbury. In the class for Aylesbury Ducks the first prize was awarded to Mrs. Semons, not Mr. Hollis.

WHITE COCKATOO (E. M. D.).—The bird picking off his feathers indicates that there is irritation of the skin. Give him a shower-bath daily by pouring over him tepid water through the nose of a watering-pot. Give him no bones nor meat, only sopped bread and fruits.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending December 13th.

COVENT GARDEN MARKET.—DECEMBER 14.

We have no improvement here worth notice, except in the best Grapes, which have advanced in price during the week, and continue very good. The Potato trade is steady, and the supply ample.

From observations taken near London during the last forty-three years, the average day temperature of the week is 43.6°, and its night temperature 30.8°. The greatest heat was 58°, on the 25th, 1827; and 28th, 1855; and the lowest cold 11° below zero, on the 28th, 1861. The greatest fall of rain was 1.13 inch.

TEA ROSES FOR OUT-DOOR CULTURE.

At page 438 are given, in reply to the inquiry by a correspondent, the names of some select Tea-scented Roses for out-door culture. To the excellence and beauty of the kinds there named no Rose amateur will, I think, take exception, but the suitability of a few of them for out-door culture is open to some discussion, and not of these only, but the subject of Tea Roses out of doors is one that might be resumed with interest.

The Tea-scented Roses (*Rosa indica odorata*) are the desire, and but too often the envy, of all lovers of Roses: they have a charm and fragrance peculiar to themselves which attract to them a preference beyond all other kinds. Their successful culture in the open ground, with a very few exceptions, is beset with difficulties. They will not generally grow where the hardier species often flourish; they require more care, more assiduous attention than any other race of Roses, and the luxury of obtaining them in quantity and variety is seldom acquired without the aid of glass structures, with pot-culture, or planting out in a house specially devoted to them.

Slowly but surely the number of varieties of the Tea-scented Roses of approved quality and sufficiently hardy for out-door planting is increasing, and among these the Noisettes may be included, for the difference between the two sections is one of degree rather than of kind, so that no Rose garden, nor any flower garden whatever, ought now to be without them altogether. The selected kinds recommended for this purpose in the list above alluded to are Gloire de Dijon, Abricote, Vicomtesse de Cazes, Devoniensis, Adam, Boule d'Or, Madame Levet, Jaune d'Or, Belle Lyonnaise, Adrienne Christophle, Montplaisir, and Madame Damazin. Of these, Abricote, Adam, and Vicomtesse de Cazes have with me proved too tender, and too dwarf and feeble in growth to withstand even an ordinary winter; under glass, however, they appear more vigorous, and potted in soil adapted for this class of Roses they produce very beautiful flowers. Boule d'Or failed to expand its bloom, in addition to its tender habit of growth. The insertion of Madame Levet in the list I am inclined to believe is a clerical error, having never heard of a Tea Rose of that name. Jaune d'Or, Belle Lyonnaise, Adrienne Christophle, Montplaisir, and Madame Damazin I have not tried.

Gloire de Dijon is well known to thrive in almost any ordinary situation. Scarcely less hardy is Celine Forestier, a deservedly universal favourite. With slight modification may be added Maréchal Niel, by far the best of all yellow Roses, and unsurpassed in depth and in substance of petal, combined with rich colouring and symmetrical form; Sombreuil is a lovely white Tea Rose of fine shape, abundant bloom, and vigorous growth. These four may all be successfully grown, even in light soils, as is the case here, budded on the Dog Rose at from 6 to 12 inches above the surface. They form handsome pillar Roses if treated in the manner pointed out by Mr. W. Paul in a recent article

in this Journal. If it can be avoided, Maréchal Niel and Sombreuil should not be exposed to the north and north-east winds. As they grow well on the Briar they will, of course, form standards; but it is especially objectionable to see attempts to prune and drill Roses into a shape they will not naturally assume.

The following Tea Roses have been fully exposed here during four successive winters—that is to say, they are planted out in front of a south wall, and no care has been taken to give them any further protection than the wall affords. They may, therefore, be presumed to be sufficiently hardy for a like situation. They are Devoniensis, Madame Bravy, Alba rosea, Rubens, Madame Willermoz, Madame Margottin, Madame Falcot, Souvenir d'un Ami, Homere, Narcisse, Goubault, President—all well-known kinds, acknowledged to be among the best of this class: they are on the Manetti stock. Madame Falcot and Goubault are most beautiful before complete expansion. Madame Margottin is a beautiful deep yellow Rose, with a peach or rose centre, and fine foliage. Homere has its petals jagged or irregularly notched, which is a drawback. Narcisse is a pretty pale yellow, and one of the freest blooming of all Roses.

The chief conditions required for the culture of Tea-scented Roses out of doors are light or well-drained soil—such as will not retain an excess of moisture during cold weather—free exposure to sun and air, shelter from north and north-east winds, occasional mulching, and a supply of well-rotted stable manure among the plants, which are best arranged in groups or in beds, and not dispersed; and further to promote vigorous growth, give a moderate watering in dry and warm weather with manure water. With these simple and inexpensive precautions it will be found quite possible to admit representatives of this noble class of Roses to a place in open-air gardening.

There is a freshness and delicacy of colouring in the flowers of the Tea Roses grown in the open air that does not seem to be so fully realised under glass: it must, however, be admitted that to have them in variety sufficient to include all or most of the best kinds, many of which are too tender for out-door culture, a glass structure is indispensable.

One more hint may be useful to those who from taste or circumstances of soil still desire to grow Roses in quantity in the form of standards at a height of more than 3 feet from the ground; at this height it is necessary, in order to secure the plants from injury by winds, to tie each firmly to a stake, and when the number of plants is considerable, the staking and tying are also a matter of considerable trouble. My respected neighbour, Mr. Tucker, of Garston House, wishing to have rows of standard Roses by the sides of the principal walks in his garden, has adopted a simple expedient which avoids the trouble of staking each plant, and which in the case of wooden stakes has frequently to be repeated. At each end of the row is a stout pole of willow, to which are affixed the ends of a length of galvanised iron wire at the required height. The standard Roses are held firmly to the wire by a soft liga-

ture of tarred string, or other substance suitable to the purpose. The poles are of willow because they take root after insertion in the soil, and therefore do not rot, but last for almost any length of time; the wire is galvanised because it is less liable to rust, and is not unsightly. When the willow poles are inserted, holes are dug in the places where wanted, and the poles, with the attached wire, are held inwards at an angle of 60° or thereabouts; they are then driven in to the required depth, and afterwards pulled outwards till they are perpendicular, when they are tightly rammed in: by this means the wires are rendered stiff by the tension. This plan appears to answer admirably; it would answer still better if two wires instead of one were attached to the willow poles. Such a contrivance is, of course, applicable to Raspberry canes, Holly-hocks, &c.

And now winter is again upon us with all its apprehensions, and which must not be forgotten, all its blessings. Among the many pleasant souvenirs which the recurrence of Christmas and the New Year bring, few, I will venture to say, will be more acceptable to the readers of "our Journal" than the genial kindly article of "WILTSHIRE RECTOR."—A. H. KENT.

CULTIVATION OF PEARS IN POTS.

MANY consider the Pear the best kind of fruit, and all know that, at any rate from September to March, this fruit is exceedingly valuable for dessert. The excellent specimens of Josephine de Malines exhibited by G. F. Wilson, Esq., of Weybridge Heath, are well worthy of notice as showing what can be accomplished by skill.

Mr. Wilson's trees are allowed to remain in the orchard house until the fruit are set, when they are removed to a favourable position out of doors. Such fruit of Josephine de Malines as exhibited could not be produced from trees planted out as pyramids or bushes. Two trees of Josephine de Malines were planted out at this place about five years ago; one of them is grafted on the Pear, and the other on the Quince. They were both good trees when planted; the ground was twice trenched, and prepared with suitable loam; they grow well, and sometimes have plenty of blossom, but little good fruit have they produced. In the season of 1866 about two dozen medium-sized fruit were produced, which ripened in February, and were of excellent flavour. With this single exception the produce has been worthless.

The varieties which have done best as pyramids and bush trees are Williams's Bon Chrétien, Louise Bonne of Jersey, Marie Louise, Beurré d'Amanlis, Napoléon, Triomphe de Jodoigne, and Jargonelle. A very large tree of Beurré Bose annually bears good crops of fine fruit. Beurré d'Artemberg also does well as a pyramid on the Pear.

On walls the finer sorts of Pears can be grown to great perfection, but not finer than they can be produced from trees in pots. I had some pots of Louise Bonne and Beurré d'Amanlis which were this season turned out of doors, when the fruit was set, to ripen; and that ripened out of doors was not only higher-coloured and of a better flavour, but quite as large as that produced under glass.

There is one Pear which can be highly recommended which has been grown here two seasons—Madame Treyve. It ripens in September, and although good Pears are plentiful at that season, it can be added to the most select collection. I selected six fruit of several of the varieties grown in pots, and weighed them. The following are the weights:—

	lbs.	ozs.
6 Williams's Bon Chrétien	3	12
6 Rivers's Beurre d'Artemberg	1	9
6 Jersey Gratioli	1	8
6 Beurré d'Amanlis	3	8½
6 Duchesse d'Orléans	2	2½
6 Madame Treyve	2	5½
6 Beurré Diel	3	14½
6 Conseiller de la Cour	3	10½
6 Louise Bonne of Jersey. (The tree, grown in a 13-inch pot, had three dozen good fruit.)	2	12

Pear trees in pots delight in rich surface dressings and plentiful supplies of water until the fruit is approaching ripeness, when it ought to be supplied to them more sparingly. About twice a-week they should have manure water. During winter, and until March, the pots may be plunged out of doors.

To amateurs and others who have not a large extent of wall-surface this method of cultivating the finer sorts of Pears might be a source of much profit as well as pleasure. The same

trees can be grown for many years in comparatively small pots; some of the trees here are about nine years old, and are in 15-inch pots.—J. DOUGLAS.

WINTER-BLOOMING ORCHIDS.—No. 11.

PHAJUS.

A GENUS of terrestrial Orchids of noble growth, containing some twenty or more species, but I purpose introducing only two of these to the attention of my readers, and they are invaluable for winter decoration. These species are extremely easy to cultivate, if it be only remembered that they are terrestrial, and not epiphytal; and the soil I have found to suit them well is a compost consisting of good turfy loam, fibrous peat, and well-decomposed manure in about equal parts, and just sufficient river or silver sand should be added to the whole to make it feel gritty. In this mixture pot the plants just previous to their growth commencing, and be sure the pots are well drained, and that the plants are not elevated above the rim, but potted like any other stove plant. Treat them liberally with water, and give them a good place in the East Indian house during their period of growth; after this is completed gradually reduce the supply of water, and remove them to a cool place, where they may remain until the end of October or beginning of November, when they should again be brought into heat, and moderately supplied with water. This treatment will soon cause the flower-spikes to show up, and grow more or less quickly, according to the weather prevailing at this time of year. Under this mode of management I have usually had some of my plants blooming at Christmas, and found them exceedingly useful just at the time when flowers are scarce and much wanted. If grown in small pots they may be used to great advantage for the decoration of apartments, and should they not be required for this purpose, they are equally serviceable for cutting.

P. GRANDIFOLIUS.—This plant seems to have been introduced into this country from the gardens of China, where it appears to have been cultivated for a long time, and I am not aware that it has ever been sent to us from a locality where it is found in a wild state. It is a fine plant, producing large, plaited, evergreen leaves, which are from 1 to 3 feet in length, broadest in the middle, and tapering to a long point; the flower-spike is about as long as the leaves, but erect, not spreading like them, and therefore shows well above them. The flowers are large and numerous; the sepals and petals brown tinged with yellow; the lip large, white in front, brown at the base. It continues long in flower, even in a cool house, or in the dwelling house, without injury.

P. WALLICHII.—This resembles the previously named species in general appearance, but is more robust, the leaves are longer when fully developed, and the flowers are also larger. The sepals and petals are of a rich brown suffused with orange yellow; the lip buff in front, but purple towards the base, where it is also tinged with orange. It is a superb old plant for winter and spring decoration, and it also makes a fine exhibition plant, if retarded by keeping it in a cool house without water during winter. Native of the East Indies.

SACCOLABIUM.

The plants comprising this genus rank amongst the gems of the order. All are epiphytes in their native habitats, but under cultivation all the larger-growing kinds thrive best when grown in pots, the only requisites being the most perfect drainage, and a little sphagnum moss to retain moisture about the roots and help to fix them firmly. The moss should be in a living state for these plants, and, indeed, I prefer live sphagnum for all these Orchids which have no peat nor other soil to grow in. Saccolabiums are all natives of the East, and are mostly found in the hottest parts. They require the same temperature and treatment as Vandas. There are many superb species and varieties, but as the majority are summer-bloomers, they cannot be included in these remarks. A small, brown, close-fitting scale is very fond of fastening upon plants of this genus, and if not removed it soon affects their health, and renders them unsightly. Strict attention, and careful washing with soft soap and warm water, I have found the safest and best method of exterminating these pests should they at any time make their appearance.

S. GIGANTEUM until recently was beyond the reach of the majority of Orchid growers, but since its price has become reasonable, no collection should be without it. The leaves of this noble plant are upwards of a foot long, and 3 inches broad, very thick

and fleshy. The racemes are longer than the leaves, and very stout. The sepals and petals are white dotted with lilac, and the lip is of a deep rich violet. The raceme would form a gorgeous head-dress for a lady, especially if backed with a few sprigs of Maiden-hair Fern. It blooms in midwinter, and lasts a very long time in perfection. Native of Burmah.

S. VIOLACEUM.—The leaves of this beautiful kind are usually a foot in length, and about 2 inches broad. It somewhat resembles *S. giganteum* in miniature. The beautiful racemes are about the same length as the leaves, or a little longer, and densely clothed with bloom. The sepals and petals are white, irregularly dotted with mauve and lilac; the lip violet in the centre, mauve at the sides. This plant is somewhat difficult to manage, but amply repays all extra care, as its beautiful and cheering spikes of flower are in perfection during the dullest season of the year. Native of Manilla.

S. HARRISONIANUM.—This differs from the preceding only in the colour of its flowers, which are pure white and very sweet-scented; indeed, it is considered by many a variety of *S. vio-*

laceum, only it blooms during the winter months, and continues several weeks in full beauty if the flowers are not allowed to get damp. It is a native of Pulo-Copang, a little island in the China Sea.

MESOSPINDIUM.

A small genus of Peruvian Orchids, of which one species only, as far as I am aware, is worthy of notice in this place. It succeeds best on a block of wood, and must be grown in the coolest part of the *Odontoglossum* house.

M. SANGUINEUM.—A small-growing plant, resembling very much some of the varieties of *Odontoglossum Alexandriae*. The pseudo-bulbs are small, oval, and compressed, bearing on their summit two strap-shaped leaves. The flower-spike is pendulous, and much longer than the leaves, bearing a profusion of waxy, deep rose-coloured flowers, and as these are produced all through the winter and spring, it is a valuable addition to our cool-house winter-blooming kinds. Native of the Andes of Peru.—**EXPERTO CREDE.**

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 9.

DRAWING PLANS.

To draw and transfer *fig. 32* to the ground, draw the square *ABCD*, and draw the diameter lines *EF* and *GH*, also the diagonal lines *AC* and *BD*. Draw lines 1, 2, 3, 4, 5, 6, 7, 8. From centre *a*, being the point where line 1, 2 crosses the diameter line *GH*, draw arc *c*, meeting the two diagonal lines; also from centre *a* draw arc *b*, as shown by radius *ab*. With radius *ef* draw arc *f*, meeting arc *b* in *d*. With radius *dg* draw arc *g*, meeting arc *b* in *e*. From centre *m*, which is equal to centre *a*, draw the corresponding arcs *b* and *c*, also arc *n*, as shown by radius *mn*. From centre *r* on line 7, 8 draw arc *s*. Arcs *n* and *s* unite where the line is cut, each arc meeting the diagonal line *AC*. From centre *t*, with radius *tu*, draw arc *u*. From centre *o* on line *EF* draw an arc corresponding to *n*, uniting with arc *u*, and meeting arc *n* on the diagonal line. Draw the remaining portion of the plan in the same manner.

To transfer the design to the ground. The base line *AB* is 40 feet long. Find points *ABCD*, as described in *fig. 31*; insert a stake at each point, and lay a line from stake *A* to stake *B*, from stake *B* to stake *C*, from stake *C* to stake *D*, and from stake *D* to stake *A*. Lay the diagonal lines *AC* and *BD*, also the diameter lines *EF* and *GH*. On each side of stake *A* measure 9 feet; insert a peg at each point, as at points 3 and 8. On each side of stake *B* measure 9 feet; insert a peg at each point, as at points 4 and 6. On each side of stake *C* measure

each point, as at 2 and 5. On each side of stake *D* measure 9 feet; insert a peg at each point, as at 1, 7. Lay lines joining points 1, 2, 3, 4, 5, 6, 7, 8; where the lines cross each other, as line 1, 2 and the diameter line *GH*, insert a peg, as at point *a*; also in lines 3, 4 and *GH* insert a peg, as at point *m*; also in 7, 8 and *EF* insert a peg, as at point *o*. From the peg at point *a*, on lines 1, 2 and *GH*, with a string 8 feet 4 inches long, trace arcs *c* and *n*; reduce the string 3 feet 4 inches and trace arc *b* until it meet line 1, 2, as at points *e* and *d*; insert a peg at each point. Radius *c* is 9 feet 9 inches from the peg at point *e*; with a string 9 feet 9 inches long trace arc *f*, meeting arc *b*

in point *d*. Shift the string to peg *d*, and with the same radius as *ef* trace arc *g*, and the bed is traced. Insert pegs 6 or 7 inches apart on the lines traced. The pegs must be put upright into the ground, and exactly in the line traced, so that when the line is laid round the pegs to cut out the bed it will have an equal pressure on all the pegs. By this simple arrangement the beds will be perfect. From the peg in point *m*, on lines 3, 4 and *GH*, trace arcs *b*, *c*; trace arcs *f* and *g* as the corresponding arcs are traced from points *e* and *d* in bed *a*. From point *m* trace arc *n*, as shown by radius *mn*. On line 7, 8, from peg 8 measure 4 feet 8 inches; insert a peg as at

point *r*; from the peg at point *r*, with a string 3 feet 8 inches long trace arc *s*, as shown by the radius *rs*, and uniting with arc *n*, as where the line is cut. On line 3, 4, from peg 3 measure 4 feet 8 inches, insert a peg as at point *t*; from the peg at *t*, with the same radius as *rs*, trace arc *u*. From the peg in centre *o*, with the radius *oc*, trace an arc corresponding to arc *n*, as traced from *m* and uniting with arc *u*, as where the line is cut. From centre *o*, on lines 7, 8 and *EF*, trace arc *c*, as shown by radius *oc*; also from centre *o* trace arc *p*, meeting line 7, 8. Insert a peg at each point, as at points *v* and *y*. From the peg at point *v*, with radius *vw*, trace arc *w*. From the peg at point *y*, with the same radius as *vw*, trace arc *x*. On line 1, 2, from peg 1 measure 4 feet 8 inches, insert a peg as at point *k*; from the peg at point *k*, with a string 3 feet

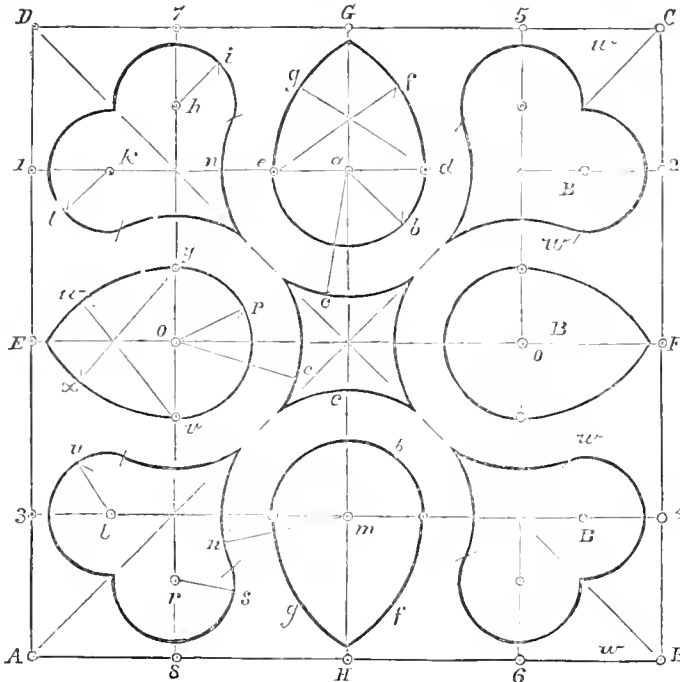

Fig. 32.—Scale 12 feet to the inch.

8 inches long, trace arc *l*, as shown by radius *kl*. From centre *o*, on lines 7, 8 and *EF*, with the same radius as *oc*, trace an arc corresponding to arc *n*, uniting with arc *l*, as where the line is cut. On line 7, 8, from peg 7 measure 4 feet 8 inches, insert a peg as at point *h*. With a string 3 feet 8 inches long trace arc *i*, uniting with arc *n* traced from point *a*, as where the line is cut. The three beds on the diameter line *GH* are now traced, excepting the side of the middle bed not marked *c*; that side is to be traced from centre *o*, bed *B*. The three beds on line 5, 6 are equal to those on line 7, 8, and are traced in the same manner.

As each bed is traced, insert pegs as at first directed. All the beds are intended to have Box-odging.—M. O'DONNELL, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

LESSONS OF THE PAST SEASON.

THE long-continued drought of the past summer will cause the year 1870 to be a memorable one. The time of the drought was one of anxiety, care, hard work, and, withal, it was a most interesting time, calculated to rouse one's best efforts to grapple with and to overcome its parching effects; a time of study and watchfulness, teaching us many a lesson for the future, showing us the importance of foresight in preparing to combat the effects of the ever-varying temperature and seasons of our fickle climate. And so before this eventful year becomes numbered with the past and is added to the short tale of our lives, it may be well to record a few of its lessons of usefulness while still fresh in the memory.

First of all, then, comes the important subject of watering; perhaps I shall be more correct if I say water supply, for, alas! the efforts and plans of many an earnest man have been rendered futile owing to the scarcity of water, caused in too many instances by the miserable provision for storing the superabundant moisture, which is suffered to run to waste during those periods of the year when it is given us so lavishly. It is astonishing how few are the gardens which are well supplied with water, or a suitable apparatus for its distribution. It may very reasonably be supposed that, when a new garden is made, so indispensable an aid to the successful development of every kind of crop would receive the attention which its importance merits, but such is not the case. An under-sized cistern, a barrel or two, and a solitary pump, but too often represent the entire provision for storing or supplying water in the driest summer, and this, too, in gardens of considerable size. Now, such a state of things is not reasonable, fair, nor wise, for it is most unfair to expect a man, no matter how clever or persevering he may be, to maintain a regular supply of vegetables, to say nothing of other things, when his best efforts are crippled or rendered unavailing from such a paucity of means.

For those gardens depending in dry weather upon stored-up rain water, a simple, efficient, and by no means expensive apparatus, may be had by building an underground-tank of a size proportionate to that of the garden, into which the water from the buildings and drains should be made to flow. Much water may also be gained by fixing a few gratings along the sides of the garden paths, the gratings to communicate with the drains. Connected with the tank there should be a fixed force-pump to convey a daily supply of water into an elevated cistern of galvanised iron, or wood lined with lead, from which, by means of a hose, the water could be distributed among the crops with much ease, expedition, and economy. Very different is the working of such an apparatus from the more common method of carrying the water in cans, often from a considerable distance. It is all very well to say what a quantity of work a willing man can do in a short time with a pair of cans; but those who advocate such a system can hardly know the labour implied in the unceasing tramp, tramp, throughout the long hot summer's day.

Wherever it is practicable, watering in summer should be immediately followed by mulching, for it is certain that in order that plants should derive any benefit from the application of water, it must come in contact with their roots, so that the spongioles may absorb sufficient moisture to maintain the health and vigour of the plants unchecked. This is, of course, the object of everyone, yet in how many instances where mulching is not used does the water fail to reach the roots even when applied daily, and so the plants linger on without making that marked progress so much desired. The reason for this is a very simple one. The burning rays of the summer sun act with such power on exposed surfaces, as to cause excessive evaporation from all porous bodies, so that the surface soil becomes so dry as to throw off ordinary waterings, it being very rare that enough water is given at one time to thoroughly saturate this dusty surface, which thus effectually prevents the roots from deriving the slightest benefit from the water, which may, and doubtless does, refresh the plants by the moisture playing among the foliage during the process of evaporation, which, as a matter of course, immediately follows. Even this benefit must be a slight one, for the action of the sun is so prompt that its greedy rays quickly evaporate the mois-

ture, and so the plants either struggle on for bare existence or die outright. But how different is the effect of judicious watering when it really reaches the roots, and by the interposition of the friendly mulching the warm moist soil retains the precious store, and the plants flourish with as much vigour as the denizens of a hothed! By way of illustration I will quote an instance of this in my own practice last summer. A quantity of strong plants of *Colens Verschaffeltii* occupying an important position had started nicely into growth when first planted in the beds, but after a time they gradually assumed that standstill appearance which is so tantalising. They had been watered regularly, but on removing the soil about their roots I was convinced that very little water had reached them. I at once set to work and raked the soil away from the stems, exposing some of the roots, and formed a little basin round the base of each plant. These basins were filled with water again and again till the soil was thoroughly saturated; it was then levelled-down and covered with a layer of rough leaf mould, and it was surprising to see the healthy change in the plants visible in a few days.

Mulching is also an important process in the culture of summer vegetables. Early Celery, Cauliflowers, Peas, Tomatoes, and a host of other crops, are much benefited by it. So highly do I esteem it, that I strongly advise its use, especially in small gardens, because—1st, It economises labour. 2nd, It checks evaporation. 3rd, It promotes that quick strong growth so essential in the production of first-class vegetables; and 4th, If it be at all of a rich nature it attracts the roots which it was designed to shelter, and thereby materially assists the crop in the latter stages of its growth.

When taking my last walk round the gardens at Egerton House, on September 21st, I paused to admire a row of British Queen Pea, which was a mass of fine large pods, and there were still a number of flowers along the top of the row. These Peas were sown in a shallow trench on the 3rd of June, they were watered a few times while in their young state, and then thoroughly mulched with some rough manure, and with the best results.

Vegetables generally were very good throughout the summer; the only exceptions were some Peas, and one or two crops of Lettuce. I allude to the Lettuce, because the failure which might have been attributed to the drought had in reality nothing at all to do with it. My rule in the culture of summer Lettuce is, as soon as one crop is visible above ground, to sow another at once. If this be done the requisite supply will be easily maintained. Another good plan is to sow two kinds at the same time. If space can be spared, it is best to sow a few rows thinly, so as to avoid transplanting. However, this cannot always be done, and it was so in my case. Two short rows of Ivery's Nonsuch, and two of Paris Cos, were sown at the same time; when the plants were large enough a number of them were pricked singly into 4-inch pots filled with old hothed manure. When a border could be spared it was made very rich with a liberal mixture of the same kind of manure, and the plants turned out with compact balls a perfect mass of roots. They were well watered, but to my surprise and mortification the Nonsuch all bolted in about a week, and on going to look at those left in the seed rows they were also in the same state. Had it not been for the Paris Cos, which formed fine hearts, a serious gap would have occurred in the supply. The cause of this failure was pretty evident, and after another sowing with the same result, it was quite clear that the seed was worthless.

The first crop of Celery, which came into use early in August, was much assisted by a mulching of short dung, for although it was watered daily, the surface soil became very dry previous to mulching, but afterwards it was always in that moist condition so suitable for this vegetable. Before the first earthing some drain pipes were placed on end along each side of the plants, so that after the earthing one end of each pipe rested on the soil close over the roots, and the other end stood out quite clear of the soil; the water was constantly poured down these pipes to the roots, thus avoiding all chance of wetting the hearts of the plants, or of the water being absorbed by the ever-increasing mass of soil.

From the very poor examples of Celery generally to be seen at horticultural shows in August, and even in September, it is evident very little attention is given to its culture early in the year. This is to be regretted, for I have always found the August Celery as much appreciated, especially for culinary purposes, as the earliest Turnips, concerning which it may not be out of place to say a word or two. If very early

Turnips are required, a crop or two may be brought forward on a gentle hotbed, but generally a first sowing on a cool border under the shelter of a north wall early in March, is soon enough. The method which I have found to answer best, is to sow small beds in the same way as for summer Lettuce—that is, immediately on the appearance of the first crop above ground, to sow another, and so on throughout the summer. This may seem a simple matter, but it is highly important; for the production of a thoroughly good succession of vegetables is an object worthy the ambition of every gardener, and one which is calculated to cause his services to be appreciated.

Another plan to which I have already alluded, and which was of the greatest possible service, is that of potting such things as Lettuce, Cauliflower, Early Dwarf Savoys, and Little Pixie Cabbage. Succession crops of these were constantly brought on in 4-inch pots filled with either leaf mould or old decayed manure. The pots were filled and placed wherever there was a chance of shelter from the midday sun. I remember somebody objecting to it on the score of the amount of labour entailed, but I have found it a saving of both labour and water; even if it were not so, I would still keep to it, because of its certainty. Strong plants turned out into their permanent quarters with such capital balls of roots as these invariably possess are almost certain to succeed.

After giving much attention to the preparation of seed Potatoes during the past two seasons, my deductions are—1st, Always to select the seed at the time of lifting the crop. 2nd, Never to store early or second early sorts in close heaps, otherwise they will sprout quickly, even before winter sets in. 3rd, Never to lay the seed in a damp dark cellar, but always to spread it in single layers if possible, in a cool, tolerably light, airy, frost-proof shed. The Potato crop of this year was most abundant; all kinds attained maturity early, and were lifted and housed in excellent condition altogether free from blight. At Egerton House, even the latest kinds were in the store house by the third week in August, yet when I came into Sussex, a month later, I saw many large breadths in the fields, with very green haulm; in several instances these crops were not lifted till late in October, and a large proportion of blighted tubers was the result. The loss thus incurred was bad enough, to say nothing of a second crop of Turnips, which might very easily have been gained had the Potato crop ripened early in August.—EDWARD LUCKENST, *Old Lands, Buxted, Sussex.*

GROUND VINERIES.

I QUITE agree with what the Editors say at page 457, "Instead of anyone entering largely on ground vineries they would sooner front a wall with glass, where a person could walk inside and attend to the Vines in all weathers." I believe I am stated to be the inventor of ground vineries, but it was only a passing thought, and I never carried out the system, although I went so far as to have a frame made of angle iron, which I see is still in existence, but under which a Vine was never planted. I cannot perceive that the slightest improvement has ever been made on this, the first structure, the four iron legs of which were so contrived as to admit of their being pushed into the earth, so as either to give freedom of ventilation or exclude it altogether. The objections I had to the system were that the Vine would be too confined; that gardeners would not like the stooping position for thinning the berries and foliage; that the bunches could not be seen so well as when the Vine grew upright on each side of a glass structure; and that the Grapes were liable to be mildewed in damp weather by being too near the earth. The only thing I could see in favour of these structures was, that any person could make one for a few shillings.—OBSERVER.

SALES AT COTTAGE-GARDEN SHOWS.

I WRITE in the hope that some of your contributors interested in the subject of cottage flower shows will kindly inform me what is the plan adopted by them with respect to the sale of produce. I act as Secretary for one lately established, and we have adopted the plan of putting up to auction after the show such things as the exhibitors are willing to sell, and this plan seems to answer well enough where the number of articles is small; but when the number of exhibitors is considerable, as it is with us, the sale takes so long that many of the visitors are gone before it is half over, and, besides that, people become tired of continually bidding for Carrots and Potatoes, which

they do not want. The consequence is that the first lots realise much better prices than the last, and the people are dissatisfied. At the same time it seems desirable to afford to the cottagers some opportunity of disposing of their produce, as it gives them a little encouragement, and those coming from a distance, especially, do not care to carry what they exhibit home again.

If anyone can give me a suggestion on the subject I shall feel much obliged.—HORRUS.

THE PURPLE BEECH.

THE various tints which deciduous trees assume when in the eere and yellow leaf have often enough been a theme both in poetry and in prose, but has not the foliage of trees charms at other times as well? Who has traversed London in spring, and not been enchanted by the fresh green foliage of a Laburnum or Wistaria, perhaps growing against the wall of a residence in an uninviting part of the town, where the very freshness of the new-born foliage contrasts so strongly with the smoke-stained objects around? and somehow the leaves look fresher there than they do in the country, where other things are less begrimed. But even foliage affords variety, and certainly quite as many tints in the growing season as in the autumn.

I will now point out one of the most ornamental of all our hardy trees, and ask the reason why it is not planted in greater numbers, for its merits in giving diversity to a landscape are very great.

The Purple Beech has, I believe, been known in England for a great many years, examples of it are often met with in shrubberies and lawns, and in all cases that I am aware of it is appreciated; yet it is but seldom planted, or when it is, some out-of-the-way place is assigned to it, in order that it may with other trees hide unsightly objects. With this I by no means find fault, provided it has an outside berth, so that its branches may have scope in one direction; and its beauties will shine in such a place as well as any other. A tree of this kind grouped with others looks remarkably well, and I would always have one or more Purple Beeches in the front row of any clump or group of trees formed in a park, or wherever ornament was considered—that is, if the soil were at all suitable, and the tree is far from being fastidious in this matter. In May, June, and July, when the country is expected to appear in its best garb, the Purple Beeches, wherever they do exist, are invariably much admired. I do not mean to say an entire plantation would look well, it would be too sombre, but a few trees might be introduced with great advantage.

To those who may be dubious of the Purple Beech attaining the dimensions of a tree I may mention that a specimen in the grounds at Linton Park, planted, I believe, in 1827, is now one of the finest trees we have; branches proceed from its stem at about 5 feet from the ground, and stretch out more than 30 feet in every direction. The spread of its branches in one direction is 73 feet and in another 67, while the circumference of the smallest part of the bole below the branches (and this is above where it had been worked), is 10 feet 10 inches, and the height of the tree must be about 70 feet, the outline being more conical than is usual with Beech trees. The situation, fortunately, is open, so that the branches have had full scope to spread on all sides, the soil dry, and the subsoil accessible to the roots of trees that strike downwards. As this tree has grown very much during the last twenty years, and seems now the picture of health, there is every reason to hope that it will eventually attain, or very nearly so (for it rarely happens fancy varieties do so), the proportions of the common Beech. Even now it may be regarded a good specimen, the colour of its foliage when it first expands being all that could be desired. I may, however, remark that seedlings from it vary much, none I have yet raised being so good as the parent.—J. RONSON.

VEGETABLES FOR THE BESEIGED.—M. Decaisne, Professor of Culture at the Museum, says *Nature*, has laid before the French Institute, of which he is a member, a scheme for the early growing of Cabbages, Radishes, &c., which are to be sown in land richly manured, kept for a fortnight, and used stem and root, as a new description of vegetable. This diet is intended to protect Parisians against scurvy when the use of salt beef becomes still more frequent than it is now. The working of this scheme is superintended by M. Joigneaux, the editor of

several agricultural papers. Different pieces of waste land close to the walls were appropriated, and vegetables of that description must be now actually on sale.

CHRYSANTHEMUM SEEDLINGS.

ALLOW me to suggest to those who purpose raising new Chrysanthemums, that a good scarlet is still a desideratum. The analogy of the colours which prevail in the Dahlia and the Chrysanthemum encourages a hope that this desideratum may yet be obtained; and, indeed, in the Anemone-flowered Firefly we have already the dull beginning of what may end in a vivid scarlet. With respect to the analogy noted above, I would add that both in the Dahlia and the Chrysanthemum we find particoloured flowers very common, and also that the white selfs can hardly be depended on, as they are peculiarly liable to assume a pinkish or other tinge.—G. S.

PLANTING FLOWER BEDS.

In the Journal of September 8th was an account from three sisters of the way in which they had planted their flower beds this last season. Their arrangements were so good that they left but little room for improvement. Mine, on the contrary, were far from satisfactory, and if any kind critic will suggest fresh ideas I shall be most grateful. The beds are seventeen in number; they are all edged with Box, which is kept in nice close order, and there are gravel paths between the beds.

No. 1 has in the centre a plant of Pampas Grass, and as it is of a feathery nature the height is no objection, as it does

not obstruct our extensive and beautiful view. Round the Pampas Grass was a circle of *Ageratum coelestinum*, then one of *Iresine Herbstii*, then double Tom Thumb Geranium, and finally, next the edge, *Pyrethrum*. The double Tom Thumb goes too much to foliage, and the *Iresine* did not succeed well until late in the season, otherwise this bed was not ineffective. Nos. 2 to 9 were all bordered with *Lobelia speciosa*, and during the short time they were in full bloom the effect of the rich blue next the brilliant green of the young Box was a decided success. Next year I thought of putting *Lobelia* in alternate plants of cuttings and seedlings, as the latter flower when the former are over. Nos. 2 and 6 were filled in with *Calceolaria Aurea floribunda*; No. 3 with *Geranium Stella*; No. 4 with *Mrs. Pollock*; No. 5 with *Madame Vaucher*; No. 7 with *St. Clair* and *Bijou*; No. 8 with *Crystal Palace Gem*; and No. 9 with *Le Grand*. Of these beds, Nos. 4, 8, and 9 did best. Nos. 10 and 16 were mixed *Verbenas* pegged down, and producing an excellent effect. No. 11 was *Tropaeolum Moor*, and No. 15 *Tropaeolum luteum*. No. 12 was the worst bed in the whole garden, although I had expended much anxious thought on its arrangement. It is the bed which is of the most consequence too, for the drawing-room window immediately overlooks it. The outside edge was *Purple King Verbena*, then a row of *Excellent Geranium*, then *Heliotropes* of different shades, and the centre filled in with *Balsame*. No. 13 was

likewise a failure. The two outside edges were common *Scarlet Geraniums*, and the centre filled with *Phlox Drummondii* of different colours. No. 14 was *Cineraria maritima* and *Centaurea*, arranged in two rows alternating with *Christine Geranium*. No. 17 was a bed of mixed *Petunias*, most of them having done well.

I have not drawn the beds outside the circle quite correctly, as they should be narrower and longer, Nos. 12 and 13 being much larger than the others. They are all in such a compact space (about 20 yards square), that the arrangement of height is quite as necessary as that of colour; any hints, therefore, from a practical gardener will be most valuable.—*IGNORAMUS, Hampshire.*

[We cannot do better at present than just refer you to the letter and plan of the three sisters of September 8th to which you allude, and to the answer and observations made on it. We should judge better of your group if we knew how it was to be viewed, whether on a level with or below the surrounding ground. In either case, but especially in the former, if the garden is to form one view or picture, then the size of the beds and of the plants becomes important. In such a case the central bed is too large, and to prevent its drowning the others you plant it in rings of colour; but, on the principle referred to, if the garden is to be viewed as one picture, then we object to the centre being a Pampas Grass, as it will be lumpy and a green mass all the time the other plants are in full bloom, and too high and massive even then.]

There are two ways of making an artistic view, so far as heights are concerned, in such a garden. The first is to have the central bed rather the highest, and the outside beds the lowest, the intermediate ones suiting in height. And the second plan would be the reverse, to have the highest outside and the lowest in the centre. We allude to these arrangements merely for convenience as respects plants, as it would be best of all if the beds, except at the edges, were of a uniform height. A few more elevated stand points might be useful for preventing the level sameness.

You seem to have commenced on the first principle by having the Pampas Grass in the centre of the central bed, followed by tall *Ageratum*, *Iresine Herbstii*, and *Double Tom Thumb*, bordered with *Pyrethrum*. Even with similar plants we think it would have been more effective with a suitable pink or scarlet *Geranium* following the *Ageratum*, and the *Iresine* or *Purple King Verbena* between the *Geranium* and the edging. But for the Pampas Grass, many other arrangements might be made. The bordering with *Pyrethrum* makes the edging of the eight beds round it very suitable and striking from its very simplicity.

Your object is to plant these eight beds in pairs on the cross system, and therefore the whole garden should be planted on the cross system. Thus, if 2 and 6 are to be pair beds, then 13 and 17 ought also to be pair beds. Looking at the planting of these eight beds, we find *Aurea floribunda Calceolaria*, *Madame Vaucher Geranium*, *Crystal Palace Gem Geranium*, and *Mrs. Pollock Geranium* would all harmonise in size and suit admirably, but then your *Geraniums* must grow very differently from ours if *Stella* and *St. Clair* in 3 and 7 did not grow in height far above all the others. Such dwarf kinds as *Lady Cowper*, *Little David*, *Harkaway*, &c., would be more suitable for the neighbour beds, and a band of *Bijou* or *Alma* inside of the blue *Lobelia* would relieve well and enhance the beauty. With the central bed lower, and these eight beds well planted and tended, the nine beds would of themselves make a pretty symmetrical garden.

We need not enter on the other beds. Mixed *Verbenas* always look well, especially if they have an edging to keep them in bounds. *Balsams* do best in a border or small beds, where there is room to show off their blooms, and not in the centre of a bed. Besides, their blooming is rather late and irregular, and in height they and *Phlox Drummondii* and seedling *Petunias* would be higher than the ring of eight beds. Such plants are not to be depended on for neatness and effect like *Geraniums* and *Calceolarias*. If such plants must be used, we would make the central bed the lowest, and instead of a Pampas Grass have a statue or an elevated vase in the centre. Then, for uniformity, as you edge the eight central beds with blue, we would edge the other eight with white; say 10, 11, 15, 16 with *Cineraria maritima*, and 12, 13, 14, 17 with *Centaurea*, or the first four might be done with *Bijou* or *Alma Geraniums*, and the next four—two of *Centaurea* and two of *Cineraria*. If these large outside beds were filled with low-growing plants, then low white and yellow variegated *Arabic*

would form compact edgings, or even *Cerastiums*, and then the *Centaurea* and *Cineraria* could come in for centres, or intermediate rows between scarlets or purples.

You state that 12 and 13 are much larger than they are represented in the sketch. As given, even, they are so much larger than the other pair of beds that unity in size is destroyed. We do not see your object in thus bringing out these two clumps with such a long tail, unless you wished to avoid the pathway between them being directly opposite the pathway in the eight corner beds. We would avoid this, and have these beds similar in size by having a circle between them. We would be inclined to do the same between 10 and 11, and 15 and 16. The whole group would then be more regular and equally balanced.—R. F.]

IMPERFECT HYBRIDITY.

AMONG the same batch of seedlings from which I obtained *Veronica Andersoni* (*V. salicifolia*—syn. *V. Lindleyana*, with *V. speciosa*) came one which, to all appearance, was a reproduction of the male parent pure and simple. And, deeming it nothing else, I presented it to a friend, *V. speciosa* being then comparatively a new plant; and he, when he flowered it, came to tell me that it had come a very different thing when in bloom from the true *V. speciosa*, having much longer flower-spikes, and being of a much lighter colour than those in that species—that is, of a light crimson instead of a dark purple as in the *V. speciosa*.

A plant of this hybrid has since afforded a further illustration of a somewhat similar result.

Having obtained a suffruticose species of *Veronica* under the name of *x V. Danbenyana*, with light-coloured flowers streaked with pink lines, in the way of *V. fruticulosa*, I crossed it on the last-mentioned hybrid, which became the seed-bearer. From this cross I succeeded in raising only two plants, and one of these I believe I have lost. But they seemed both alike in foliage and habit, but both so like the hybrid seed-bearer that I felt doubtful whether the cross had taken. I cannot speak with confidence as to their being identically alike, but only of their general aspect. The plant I still possess flowered for the first time this past season, and the singularity of its bloom drew my attention to it more particularly than before. It had, like the seed-bearer, thick, fleshy, oblong leaves, but somewhat smaller and more closely set on the stem; but instead of being, like it, simply crassiform [?], they were obliquely decussate, therein slightly approaching the male parent, a creeping alpine species, whose prostrate stems show still more the same deflected arrangement of the leaves. It was only on a close examination of the parts, however, that any resemblance to the male, *x V. Danbenyana*, could be observed. In fact, I looked upon it as another of the many failures I had had in my attempts to effect the inverse cross on it. When it at last bloomed my hopes of having effected a partial cross, if I may use such a term, were strengthened. Like *x V. Danbenyana*, which has a spikelet with a few blooms, it came even short of it, having had only two flowers, and these much lighter in colour, and so nearer to the male than the hybrid female parent. But whether this is its true permanent character I dare not assert, as it bore no more than this one spikelet of two flowers.

In the first of the above instances the hybrid seemed, till it flowered, a repetition of the male parent; in the second it seemed, till it bloomed, a repetition of the female parent, with such slight differences in the arrangement and slightly smaller size of the foliage as might occur in a purely normal seedling. In fact, seldom have I ever seen two hybrids with so much of one parent and so little of the other.

I have no doubt something of the same kind occurs among *Rhododendrons*; but I may only instance two cases—one where I crossed *R. Edgeworthii* on *R. canescens*; the seedlings, always few when the cross is a severe one (by which term I mean such instances as where the species do not affect each other kindly), were only two in number; and though now about ten years old, they show no indications of setting for flower. But while they have both the glabrous foliage of the seed-bearer, and even the ochraceous tint underneath, they differ in having oblong instead of its lanceolate leaves. But, though in these particulars they depart from the normal state of *R. canescens*, they have not one feature of *R. Edgeworthii*, the male parent. The other case is where I crossed the same, *Rhododendron Edgeworthii* on *R. Jenkinsii*. Here the seedlings, again only two in number, were all of the mother, except by having again the oblong foliage, in which, he it observed, it is a departure from both parents, both having lanceolate leaves—those of *R. Jenkinsii* being acutely so, but the hybrid in these latter cases is budded for flower, but the flowers of both parents are white, and both sweet-scented, and both among the largest of the genus; the scents, texture, and forms of the flowers are different, so that I look for surer tests in the coming flowers—though these may be perplexing too—than any that yet appears. It is proper to observe that I take the utmost precaution, in all my crossing operations, to prevent miscarriage in any possible way.

While treating of my difficulties with the *Rhododendron Edgeworthii*, one of the most peculiarly constituted, as it is one of the most peculiarly featured, of all the *Rhododendron* tribe—having its rugose leaves densely pubescent on the upper, while it is perfectly shaggy with

tomentum on the under side, every stem being clothed with the same tomentum—I have another most singular peculiarity to note in regard to it, viz., that while it will cross other species, it will take on a cross from none; that is to say, while it has been repeatedly made the male, it has never with me, though I have tried it often, nor with anyone else that I have heard of, submitted to become the female parent. I have crossed it repeatedly on *Rhododendron ciliatum*, one of the minor forms, too, of *Dr. Hooker's Himalayan species*. It has been crossed on *R. formosum* in this neighbourhood, I believe in the *Stunwell Nursery*, but I never could get it to take on any cross whatever. *Rhododendron Nuttallii* behaved with me in the same manner; it would cross but not be crossed. But I did not persevere with it as I did with *R. Edgeworthii*. Now, I do not assert absolutely that *Rhododendron Edgeworthii*, in the numerous tribe of which it is a member, may not be hybridised with some other of its kindred, but I could never get it to reciprocate a cross.

And this remarkable circumstance of non-reciprocity has perplexed and defied me in innumerable instances throughout my long experience in these pursuits. It occurs to me that the pollen of larger forms might be of larger grains, and so might not pass through the necessarily small ducts of the styles of smaller species. Yet *Rhododendron ciliatum*, a tiny species of 1 foot high, was crossed freely by *R. Edgeworthii*, as I have just noticed—a species 6 feet high. I even crossed this latter species on a pure Indian *Azalea*, though, by pulling the seed-pod before it was ripe, I raised no seeds of this latter cross.

In these hasty observations I merely wish to direct attention to such instances of imperfect hybridity in certain species, and the non-reciprocity in others, as I have noticed, in the hope of perhaps drawing out from others their experience on such matters, which I humbly think are not unworthy the consideration of the Scientific Committee.—E. ANDERSON-HENRY—*Read at the last meeting of the Scientific Committee of the Royal Horticultural Society.*

GARDENERS' PRIZES FOR VEGETABLES AT

THE ROYAL HORTICULTURAL SOCIETY'S NOTTINGHAM SHOW.

At a meeting of a committee of gardeners, held at Stamford, for the purpose of carrying out Mr. Gilbert's scheme for gardeners' prizes for vegetables at the Royal Horticultural Society's forthcoming Show at Nottingham, Mr. Smith, of Exton Park, was appointed Honorary Secretary and Treasurer; and as it is necessary that the amount required (£20), should be collected without delay, in order that the prizes may be placed at the disposal of the Society in time for the issue of the local prize schedule, it is requested that all gardeners desiring to subscribe will at once send their subscriptions to Mr. James Smith, Exton Park Gardens, Oakham; post-office orders to be payable at Oakham.

It was determined at the meeting that the amount should be divided into three prizes, of the respective values of £10, £6, and £4, to be given either in watches or money, at the option of the winners. An offer by Mr. Chapman, of Gloucester, of one of his patent exhibiting cases as a further prize, was accepted. The following subscriptions have been received by the Honorary Secretary and Treasurer:—

	£	s.	d.
Gilbert, Mr., Burghley Park, Stamford	0	5	0
Smith, Mr., Exton Park, Oakham	0	5	0
Caldar, Mr., Casewick, Stamford	0	5	0
Easton, Mr., gardener to T. Laxton, Esq., Stamford	0	5	0
Meiken, Mr., Reed Hall, Whalley	0	5	0
Peasey, Mr., Quorn Lodge, Loughborough	0	5	0
Taylor, Mr., Longlet Gardens, Wramster	0	5	0
Mitchell, Mr., Ruddington Hall, Nottingham	0	5	0

CYCLAMEN SEEDLINGS BLOOMING WHEN TEN MONTHS OLD.

ONE of your contributors (page 467) says that *Cyclamens* exhibited at the Royal Horticultural Society were grown from seed, and flowered fit for exhibition in ten months. How is it to be done? I should certainly be glad to know.

I sowed seeds of the Persian *Cyclamen* on the 10th of March last, pricked them out into small pots when large enough to handle, and repotted them in August. They now look very healthy, but they are very small, and I fear will show but little bloom even twelve months hence. I am a great admirer of that beautiful flower the Persian *Cyclamen*, and should be pleased to be able to grow it more quickly, and so, I doubt not, would be a great many more of your readers.—W. SCOTT.

[We wish some of our readers would detail the mode of so hastening the *Cyclamen* seedling's flowering.—EDS.]

"PEAS IN DECEMBER—ICE IN JUNE"—were the wonders of our ancestors, but with us are no rarities. One instance is now before us. Mr. Bannister in his garden, on St. Boniface Terrace, Ventnor, Isle of Wight, gathered a dish of green Peas

on the 7th inst., and unless more severe weather sets in he is confident of being able to do so at Christmas.

MIMETIC ANALOGY.

The following is an extract from notes read by Mr. Murray at the last meeting of the Scientific Committee of the Royal Horticultural Society.

"Although mimicry occurs between various tribes or genera, it has been observed most frequently in connection with the most common species of the country. This is what would naturally be the case with hybridisation, supposing all to start fair, and to be equally liable to hybridisation. But this is an assumption which we are scarcely warranted in making, and I therefore do not press this inference further than as of some conditional value.

"After the second generation of hybrids, those which do not revert to the type break out into an overflow of irregular variation, which supplies many of his most remarkable sports to the horticulturist, and many of his most puzzling difficulties to the systematic botanist. On the assumption that the mimicry in question is the result of hybridisation, we should therefore expect to find a marked degree of variation among the mimicking species. And so we do."

Mr. Murray cited evidence on this head, and then continued:—

"It seems a fair inference that when the mimicking species are not variable, they have been established before the second generation of hybrids, and where they are variable they have been established subsequent to the second generation, and have experienced the usual shock to stability occasioned by such repeated loosenings of the fetters of specific identity.

"Mr. Bates' list of mimics and mimicked species shows, too, that when a species is mimicked by one species or genus it is often mimicked by more—a fact which, applied to the idea of hybridisation, simply means that that species had a readiness to take to itself wives of more than one of the nations round about. It is only what we find in plants—that some are more open to hybridisation than others, or perhaps analogous to our moral experience, that where scope is allowed to our own passions, license soon degenerates into libertinism.

"Another feature familiar to all hybridisers occurs in these mimicries. Notwithstanding the statement of Whicura to the contrary, it is now perfectly well known that in attempting to obtain a cross between two species, we often fail when we work with the male of one species and the female of another, while we succeed when we reverse the process, and take the male of the latter and the female of the former. In plants, the cases where this capability of crossing in only one direction occurs are beyond numbering. Mr. Isaac Anderson-Henry cites many of them in his late Presidential address to the Botanic Society of Edinburgh, and in the paper which I have now the pleasure to lay before the meeting. The very same thing has occurred with the mimicries recorded by Mr. Bates. They are all on one side of the house. The case which so often occurs in plants has obviously occurred among the butterflies. The cross has taken only from one side—which is it? Judging from the example of the mule it should be on the side of highest organisation; that is, that the male parent has been of the lower organisation, and the female parent (the actual bringer-forth) of the higher. Now, which is the side of highest organisation in the Danaids and Pieridae—is it that of greatest strength? If it were so, it would then be the Danaids, for they are larger, finer, and more powerful than the more northern whites. But organisation is a higher test than mere strength, and an advance in it is doubtless what must be the unconscious aim of the ambitious match-seeker. This, too, seems to be on the side of the Brazilian tribe. Mr. Bates so considers it, and his reason is that the essential quality of butterflies being flight, the type which has most attention paid to its wings and least to its legs must be highest of its order. Others think differently, and say that a type which has had two of its limbs (its fore legs) almost atrophied cannot be so perfect an animal as one which has them all in perfection. But I agree with Mr. Bates on this point (at all events in his conclusion). The greater number of legs cannot be any indication of higher organisation, or a centipede might dispute supremacy with ourselves, and push us from our stools. The fewer limbs, that is, the simpler the apparatus that a creature can do its work with, the higher the perfection of the machine. Therefore, doubtless, the cross from which these mimics resulted was one by the males of the whites upon the females of the Danaids.

"Now what does plant-hybridisation tell us on this point? What does Mr. Henry say? I regret to differ from so great an authority as Whicura (who had maintained that 'the products which arise from reciprocal crossing in plants, unlike those which are formed among animals, are perfectly alike'), and must venture to demur to the doctrine in more decided terms than Mr. Berkeley has done. I have had so many instances of hybrids taking sometimes to one side and sometimes to another—but most frequently to that of the mother—that to those who, like me, have tried their hand with many genera, it would be a matter of supererogation to give instances. I have had them by the score."

"But the mixed product also corresponds with another fact observed in hybridisation. Mr. Henry informs me that in some of his crossings of plants he has only succeeded in altering the flower, the foliage continuing persist the same as that of one of the parents. He

has not succeeded in distributing the notion through all parts. That is exactly parallel to what we see in these mimicries. In plants it may be a question whether we should consider the flower or the foliage as the more structural parts; for my part I should take the flower as the more important, and therefore equivalent to the structure of the legs and wings, and the foliage and habit of the plant as equivalent to the colour and form of the wings, and general appearance of the insect. In Mr. Anderson-Henry's case another phase of the mimicry, which I have no doubt will be found to have also its parallel in the hybridisation of plants, although I am not able to cite any instances exactly in point, is, that in species which have dissimilar sexes it sometimes extends to both sexes, the males being like the males and the females like the females, but in other instances is confined to the females. I believe that the reason why I have no case in point to cite in plants is, that it can only be had in dioecious plants; and the hybridisation of dioecious plants has hitherto been scarcely at all attended to. Mr. Henry has some coming forward, but they have not yet flowered.

"The last point to be noticed is one of some importance, as being the only one furnishing a shadow of objection to the explanation of the mimicries in question by hybridisation. It is, that the nearest natural allies of both the mimickers and mimicked are not always to be found in the same district as them. This deserves the more attention, that it appeared so strong to Mr. Bates as to lead him to relinquish the idea of hybridisation as an explanation after it had crossed his mind.

"Before I proceed to show how simple the explanation of the absence of one of the parents is, I must beg to note, in passing, the admission that there are distinct forms whose intercrossing would produce the hybrids. That granted, I would remind the reader of what Mr. Bates has obviously overlooked, that we are dealing with a phenomenon, probably of a very ancient date, and that one side of the parental stock may have disappeared in the course of time. One of the parents we know to be present (the so-called mimicked), but there are excellent reasons, based on climatal considerations, why the other parent should not be present.

"There is yet another phenomenon connected with mimicry, which possibly may also be connected with hybridisation—viz., the occurrence of what Mr. Wallace has called dimorphism in insects among the mimicking or mimicked species. We must not, however, confound this dimorphism with Darwin's dimorphism in plants. The two are totally different things, and, as it seems to me, have no relation or analogy to each other. In plants the dimorphism is always confined to the reproductive organs, in insects it has apparently nothing to do with them. Moreover, it seems to me that all the instances of so-called dimorphism in insects that have yet been recorded are nothing but examples of variation, perhaps complicated by hybridisation."

ENTOMOLOGICAL SOCIETY'S MEETING.

The second meeting of the present season was held on the 21st of November, the President, A. R. Wallace, Esq., in the chair. Amongst the donations to the Society's library were the publications of the Entomological Societies of St. Petersburg and Italy, the Royal Society of London; and a memoir on the cultivation of silk in the Australian Colonies by Captain Hutton, published at Calcutta during the present year.

Mr. F. Bond exhibited *Fumea reticella*, male and female, the latter distinguished by the absence of wool on the terminal segment of the body; also *Aecialia strigaria* and *Physcia obductella*, all taken near Gravesend by Mr. Button. Mr. Albert Muller exhibited a specimen of the large fleshy larva of the Longicorn Beetle, *Egosoma scabricorne*, which infests the trunks of Lime trees in the great square of Basle in Switzerland. Mr. Frederick Smith sent a number of specimens of a small dipterous insect, *Phora florea*, the larvæ of which infest the interior of the bodies of the larvæ and pupæ of the common Wasp, as many as fourteen having been found in a single Wasp-grah; and out of a comb of 200 or 300 cells, only a few Wasps escaped the attacks of this little insidious fly.

Mr. Butler read a memoir containing descriptions of new exotic species of Butterflies of the families Nymphalidae and Hesperidae in the collection of the British Museum from Venezuela, and in Mr. Dawe's collection from the Kaden Museum.

Mr. F. Bond stated that at the late exhibition of the Haggerstone Entomological Society he had observed a singular specimen of *Vanessa Atalanta*, having the head of the larva remaining upon and concealing the head of the Butterfly; also a curious specimen of the common Brimstone Butterfly, having the wings streaked with the colours of the opposite sex.

Professor Westwood stated that he had recently reared a number of specimens of *Phloiotribus Oleæ* from the stem of an Ash tree imported from France. It had hitherto only been reared from the Olive tree in the south of France.

BEECH FOR CHALKY SOIL.

Will you permit me to say that you are perfectly correct in recommending to your correspondent to plant Beech trees in a chalky soil? I am at present residing in a locality where there is nothing but chalk, and the Beech trees grow magnificently;

indeed, it seems to be their natural "habitat." It is interesting to the naturalist to watch the great numbers of the "pied finch" which feed upon the nuts when they fall upon the ground. Alas! it is equally to be regretted, that in this district, where the thrush and blackbird abounded so much as first to attract me favourably to the locality a few years ago, scarcely a bird exists to welcome in the approaching spring. Surely something might be done to stay the wanton destruction of our British birds.—HORTICULTURER.

IRON GRATINGS FOR BOTTOMS OF MUSHROOM BEDS.

HAVE any of your readers ever used iron gratings for the bottoms of Mushroom beds? I saw them in use some ten years ago at Hardingstone, at the residence of the late Mr. W. H. Barwell, iron-founder, of Northampton. The gratings were of cast iron, made to the width required, and were used for the bottoms of the beds instead of boards. In making up the beds turf was first placed on the grating grass side downwards, and the beds were filled up with droppings and spawned in the usual way; the result was that as many Mushrooms came through the grating at the bottom as on the top of the bed, thus giving a double crop. When I saw them the bed was completely covered, top and bottom, with Mushrooms of all sizes, some of them 6 or 7 inches in diameter. The spawn used was taken from a hovel on the premises which had been used by cows and horses in the winter and spring before, and as the material was undisturbed all the summer it was found in the autumn to be a whole mass of spawn.—H. HARRIS, *Gardener, Naseby Woolleys.*

[We have met with such Mushroom-bed bottoms, and doing well. We know of no objection except the rusting of the iron. That could be avoided by placing the pieces of grating in a galvanising trough, but we are not aware how long the galvanising would stand the steam from the dung. We should have no objection to such a house being all iron inside. When wood is used we prefer the bottom of the beds to be sparrow instead of close, as in the former case they are more easily influenced by the heat from the bed beneath. We have frequently thus had double crops, but in shallow beds we thought the crop on the upper surface was sooner exhausted.]

WORK FOR THE WEEK.

KITCHEN GARDEN

In most gardens in the country leaves can be collected, and when properly managed they form, perhaps, the most useful source of bottom heat with which we are acquainted, except, of course, the tank. All the leaves necessary for carrying on the business of the ensuing year should be collected as early as possible in the autumn, and be placed close together to ferment. After fermenting for three weeks or a month they are in excellent order for use; in this state they will both heat with more certainty and tread more closely. In order to be ready for forcing of all kinds, to form powerful linings, or to build new beds, it is necessary to have at hand a mixture of hot dung and leaves. In the course of this month, therefore, the whole of the hot dung should be drawn from the stable yard to the leaf yard, and immediately thrown together and well watered in order to dispel the fiery heat. When fermented thus for a week or so, it may be mixed with leaves. About four parts of the leaves to one part of hot manure will make a powerful and enduring mixture, and in most cases provide a bulk of material which will carry on all the hotbed and lining work for two months to come. Thus provided, a gardener can make up a frame or pit at any time, or furnish new linings, at a couple of hours' notice; for if the dung has had one powerful heating previous to its being mixed with the leaves, little danger need be apprehended from impure vapours, provided the most ordinary precautions be observed. The wet weather we have experienced will, in some situations, have greatly retarded much that would otherwise have been done; it is therefore necessary

to forward all that can be done within-doors, so that there will be no hindrance to out-door work when the weather becomes fine. There are numerous operations which can be performed by labourers within-doors, and which, if not immediately necessary, may at some time reduce labour when most wanted. The making of labels, brooms, flower-sticks, shreds, &c., is usually done in bad weather, also the cleaving of wood. Take advantage of a dry day to lay tiles over some of the *Endive* in the open ground; take up a portion of the best, and lay it in a frame or shed as a reserve in case of severe frost. In favourable situations, where neither forcing-houses nor pits are at command, another sowing of *Peas* and *Beans* may be made, but where a common frame can be spared till March it is far preferable to sow in pots. *Radishes* sown in frames must have air as soon as they make their appearance, if the weather permit.

FRUIT GARDEN.

Proceed with pruning and nailing as opportunity offers. Apples, Pears, Plums, Cherries, Gooseberries, Currants, Raspberries, and Grape Vines should all be proceeded with. All spare nails should now be drawn from the Peaches, Nectarines, and Apricots. They should be sorted, dried, and cleaned ready for immediate use.

FLOWER GARDEN.

Go on according to the advice of last week. Take the first opportunity, when fine weather sets in, of carefully looking over Carnation layers that are in frames. It is possible that soil may have settled in the axils of the leaves; as this retains moisture in a very inconvenient degree, it is highly necessary for the health of the plants that it should be removed. With respect to Ranunculuses, lose no time in making purchases, and take care during this rather variable weather that the roots do not contract mouldiness, which is fatal to them. In concluding my directions for the present year I would counsel all cultivators of florists' flowers, and especially those who are about commencing, always to bear in mind that quality is preferable to quantity, and that it is the best policy to purchase good strains and good sorts.

GREENHOUSE AND CONSERVATORY.

Keep as moderate a temperature as possible when the Camellias are in bloom, in order to prolong their season. Drip is generally found inconvenient during a frost, and it may be advisable to withhold water altogether for a few days; or cover the roof with a canvas screen, which, by preventing condensation through a low roof temperature, will accomplish the object more effectually. The conservatory should now be very gay, and, if former directions have been attended to, some of the finer kinds of *Azalea indica* will be developing their charms—such as *Exquisita*, *Coronata*, *Carminata*, *Variegata*, *Lactaria*, and *Gleditsiana*; with these there may be a few *Ixoras*, *Allamandas*, and some other stove plants, several kinds of *Chorozemas*, *Boronia pinnata*, *Styphelia tubiflora*, a few kinds of *Heaths* and *Epacrises*, and some minor softwooded plants. In the greenhouse look well to plants in a growing state, such as *Dioscoreas*, *Pimeleas*, &c. Remove the bloom as fast as it appears; but those plants of the former which are intended for early blooming must not have their flowers removed after the first week in January.

STOVE.

Here all is still and quiet. Keep up a moderate heat of from 50° to 60°, and give plenty of air. The *Ixoras* should be elevated near the glass to set their bloom, and have plenty of air at all times. Keep them comparatively dry. *Stephanotis*, *Allamandas*, &c., may be potted and trained preparatory to starting after Christmas, and the staking of all specimen plants must be proceeded with as fast as possible. It will soon be time to commence potting *Orchids*. Let a stock of proper materials be provided without delay. Free fibrous heath soil cut into squares about the size of walnuts, fresh sphagnum chopped or cut, plenty of broken crocks, charcoal in lumps, and some chopped sticks (avoiding Fir wood), will all be found necessary. The whole of these materials, except the crocks and charcoal, should be subjected to some process that will destroy snails and other insects, with their eggs. The sphagnum and heath are generally scalded, but from experience an objection is taken to this, as the process so much hastens decomposition in the vegetable matter that it soon becomes a pulpy mass impervious to the atmosphere. It is better to lay it in some warm and dry place, turning it occasionally.

FORCING PIT.

Introduce such plants as are generally used for forcing,

especially the sweet-scented subjects, as Lily of the Valley, Sweet Briar, and Lilacs, and do not forget to introduce a good batch of Roses, choosing the most promising plants of Texas, Bourbon, and Hybrid Perpetuals, which are the best kinds for winter flowering. A gentle bottom heat will be of great service to these, also to most other plants subjected to heat, in order to flower them as quickly as possible, and a moist state of the atmosphere must be secured, admitting a little air freely at every favourable opportunity. Dutch bulbs should be largely used for forcing at this season, and when hardy shrubs are forced for the decoration of the conservatory, these should be brought into bloom as soon as circumstances admit. Some persons, however, think that it is worse than waste of time and space to force such common things as Rhododendrons, Azaleas, and other American plants, as, with equal care and no more expense, much finer flowers may be had at this season without forcing. All forcing plants intended for succession should be under a temporary covering of some kind—an open shed is as good a place as they can be put in, or under the stages of a greenhouse.

PITS AND FRAMES.

Give plenty of air to Violets, Mignonette, and Intermediate Stocks in frames or pits. Avoid watering as much as possible; it is better to let the plants flag a little than to have the soil too much saturated at the roots.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

LITTLE has been done here excepting covering Celery in frosty nights, clearing breaks of old Cabbage plants, and spreading a little manure and material from the rubbish heap on the bed, to encourage the sprouts until the spring, as they help to keep us from going so often to the early Cabbage quarter. Drew a little more earth to the strong early Cabbages, as it keeps them firmer and more secure from frost. Put some old sashes over a fine late bed of Radishes in an earth pit, to protect them from severe frost and wet. The rains of late have been so heavy that we have done but little on our heavy ground, but when the weather was fair we collected a lot of tree leaves, though we would rather have had them dry, but when dry weather comes there will be groundwork demanding attention. Turned over manure heaps intended for Mushroom-beds, for which we must have them dung rather short and moist, saving only a few horse droppings for covering.

There has been plenty of work under cover in wet days—in fact, our wettest days are generally our busiest days, and indoor work is sometimes delayed too long that it may be done in such weather.

Water.—The ponds in many places are filling very slowly, except where there is a great command of surface water; as the ground drains act but little owing to the moisture absorbed by the dry soil. Owing to our now having more piping to buildings, our tanks in the garden are nearly full, and we only wish we had three or four times the space for clean water in reservoirs, as then we could look forward to the summer without alarm. Such a season as last ought to teach many a lesson in dry districts. Good tanks and ponds now would soon pay the expense of horse labour in carting during the summer. We wish the water that has run to waste of late, could be converted into a little lake. Where this has been done in some places, there is no standing still in summer, where formerly there was a constant annoyance about water-carting. Draining is all very well, but it would be a benefit in many places to collect the water from drainage, instead of letting it off as it came to the nearest outfall. Can anyone tell of a cheaper mode of making a fair-sized reservoir than puddling with clay? The worst of clay puddling is, that unless fringed with grass, it is apt to crack in summer, when the water sinks, and then away goes the water. Of course, nothing is better than bricks and cement, but they are expensive. Even large tanks done in the best way will always stand best, if the walls instead of being perpendicular should be bevelled outwards from bottom to top. From inferior cement and inferior workmanship many tanks do not stand well—that is, do not hold water. The finest brick ever burned is useless for such a purpose when used as it comes from the kiln.

FRUIT GARDEN.

The work has been much the same as in previous weeks. We would have done more outside work if we could. We placed all the Strawberry plants under protection; during bad weather

they were previously protected with litter. We shall soon move some from frames into heated pits and houses. We would have done so earlier, but could not obtain runners early last season.

We finished with the Fig house, and hope we have settled the bug that visited us there for the first time; at least, every bit of wood and brickwork was pretty well examined, and treated with water as near the boiling point as possible before lime-washing, painting, &c. We have been told that burning sulphur fumes will settle it, but then the fumes will kill vegetation of every kind that is growing, and can only be used where the wood of deciduous plants is thoroughly ripened, and there is no chance, from openings in divisions between houses, for the fumes to go from an empty house to one where plants are growing. Pruned and cleared a second viney preparatory to filling it with plants.

We have had several inquiries as to the use of

Brick Pits in Forcing Houses, and using fermenting material for starting Vines and Peaches. Where convenient, such pits inside a house are very useful. In the early part of the season they might be used as hotbeds, covered with glass, whilst the general atmosphere of the house was kept comparatively cool. When that was no longer desirable the glass, &c., might be removed, and then how well would the bed come in for plunging pots that would require a little bottom heat! When that was not wanted, and the bed might sink too low, a sparred table or trellis placed over it would be the place on which to set plants thickly, to suit the shaded roof. When none of these uses are required, and Vines and Peaches are to be forced, then these pits filled with fermenting material will be one of the best modes for softening and breaking the buds. When rank dung is used for this purpose, then no evergreen plant and no deciduous plant, unless when in a state of rest, ought to be in the house. It is safest to have no plants at all in the house. For Peaches we should not like to use stable manure fresh until it had been thrown into a heap for eight days, and thus lost its rankest steam. For Vines with moderately-ripened wood such care even is not required. Litter and droppings may be brought at once from the stables, and, however rank the steam, it will do no harm to the Vines if not too near them, but will destroy every kind of insect, as the strong ammoniacal fumes will penetrate every hole and cranny, and the moisture will soften and swell the buds. In using sweet fermenting manure there will be no danger to anything that stands heat; hence a heap of tree leaves in a house is useful and safe. Turn them as you will, the steam from them will be sweet and safe. We have used stable dung fresh in a large house in such quantities that for a fortnight one could scarcely walk through the house, and the confined steam prevented one seeing far before him. No insect could live in such an atmosphere. The great thing with such mounds of dung was, by frequent turning, to get it perfectly sweet, though hot, before the buds swelled to breaking; after that, rank steam would be very injurious. The gases that escape from sweet decomposing manure are a great help to healthy, vigorous growth. Those from stable manure are more powerful than those from leaves, but a large heap of the latter and also of tan are harmless as to the gases they throw off. By forking over such heaps we have often filled a house with the richest steam when we wanted to do so. Forced to use every available place under glass almost constantly, we could not use fermenting material now, but none the less are we convinced of the importance of a hotbed in a house as a great help in early forcing.

ORNAMENTAL DEPARTMENT.

The Christmas Rose.—How interesting even among the snow does the *Helleborus niger* look, though anything but striking as a rough herbaceous plant when not in bloom. Even the *Helleborus foetidus*, with its fine foliage, would be no bad object in a sub-tropical garden. We are glad that *H. niger*, which yields its large flowers so early, is becoming more popular, as we may judge from the care taken of every lot by a neighbouring nurseryman in summer, so as to have good saleable plants before winter. There were several things that attracted our attention in the same nursery, such as the collections of fine old herbaceous plants and spring-flowering plants, telling us that the days are coming when we shall have mixed herbaceous borders again, and plenty of spring-flowering plants to fill our flower beds, with the addition of bulbs. Even as respects bulbs, we see proofs that ere long we may not be quite so dependent on our friends in the Low Countries, not, perhaps, so much in what our friend called his Californian gold field—a large space of Winter Aconite, from which numberless roots of

the largest sizes are taken every autumn, leaving enough to bloom thickly, and to seed and sow themselves from year to year; or in the large spaces of *Crocus*, and whole quarters of Snowdrops, grown for the general market; but in some parts water cannot be far from the surface, and we should not be surprised some day to see large quarters of the best Hyacinths, for the sale of the bulbs.

Having alluded to the general management of plants and houses lately, we may say now, that a little bottom heat from tree leaves will be a great help to Roses, Dantzas, Lilacs, Rhododendrons, *Spiræas*, double flowering Peaches, &c., placed in pits or houses. It is as well, if the roots are well established, to set the pot on the top of the bed for the first week or ten days, and then to plunge, or partly plunge, if the heat is mild. The varieties of the Chinese Azaleas answer admirably under such treatment, and will not need so much air as the above hardy subjects will require at first. All such plants, and even Camellias, will be better of a little manure water when swelling and opening their buds, and so will plants of *Salvia splendens*, where there is heat enough. One great advantage of this bright old plant is, that when taken to a coolish greenhouse until the flowers are nearly over, it will often, when deprived of the old flower stalks and slightly pruned, if taken back to a warmer place averaging 60°, bloom two or three times before getting exhausted. The late Chrysanthemums will also rejoice in manure waterings.

Such tender plants as *Eranthemum*, *Justicias*, *Goldfussias*, *Poinsettias*, and *Euphorbia jacquiniflora* are much benefited by manure waterings, clear and not too strong, whilst the bloom will be brighter in proportion to the light they receive. How pretty at this season is the old *Rivina humilis*, with its long racemes of bright red berries pointed with a few little white flowers! To have it nice and healthy all the winter and spring, there is no better plan than sowing every season in a hotbed in March, and growing the plants in rather small pots. There is generally some drawback as respects some of our greatest favourites. Thus, unless you have a very large plant it is next to impossible to have a fine compact bush of the *Poinsettia*. Small plants for little vases in heated rooms will always be rather long for their width. The *Poinsettia* can never be made to look compact so as to have a fine head of crimson floral leaves. You must have a tall strong shoot that will bear no stopping or pruning. Such a glorious crowned head, if the stem is cut carefully to a joint, will stand a good while in water or damp moss in a heated room, forming with a few Maiden-hair Ferns a fine feature in a vase of flowers. The rich crimson leaves when pulled off separately stand even longer, and form a rich dressing for the sides of small vases. When done flowering the *Poinsettia* may be kept drier and cooler, and the shoots may be cut down for propagating in spring, and as every bud will make a cutting, the shoot may thus be cut up into pieces from 2 to 12 inches long. To insure fine heads of floral leaves the plants can scarcely have too much heat, moisture, and light in summer; and comparative dryness, less heat, and full light in autumn, but not so much dryness as to cause a leaf to fall. When placed in more heat and moisture the flower and floral leaves soon appear.—R. F.

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Sutton's Amateur's Guide and Spring Catalogue*.

Hooper & Co., Covent Garden Market, London, W.C.—*Seed Catalogue*.

TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

Books (*Treats*).—“The Cottage Gardeners' Dictionary” gives directions for Cacti culture. We know of no separate work on the subject (*J. E. M.*).—The “Gardeners' Almanack and Poultry-keepers' Calendar” has not been published since 1863. You can have a copy free by post of that, if you enclose thirteen postage stamps with your address.

LAWN SAND (*W. D. E.*).—We do not know it, and we cannot withdraw our opinion.

MANURING ROSES (*Rosery*).—Winter is not the best time for applying guano to Roses, though this manure is very valuable when Roses are in full foliage. We should advise the cesspool to be emptied about March into a heap of sod and ashes, and this applied as a top-dressing to the trees, forking it in among the roots. Let the guano be applied as a liquid manure while the Roses are forming their buds for blooming, or at any time during the summer when the weather is very dry. It is too stimulating and transient in its effects to use as a winter dressing. When the land is sandy, as in your case, a mulching, applied during the winter, of good stable manure, is of great value. It can be raked off in spring,

and what is left forked in, and a mulching of coco-nut fibre may be applied during the summer to protect the roots from the sun in hot dry weather.

RUSSIAN VIOLETS (*Sunny*).—All Violets are the better of a situation shaded from the midday sun. An east border is a good aspect. They flower from February to May, and in mild seasons they commence flowering early in winter, and continue in bloom throughout the winter and spring.

ROSES FOR COVERING IRON ARCHES (*Idem*).—There are climbers suitable for planting with Roses, and we should not employ Hybrid Perpetuals, but the climbing Roses, as—Alice Gray, Dundee Rambler, Ruga, and Splendens, of the *Ayrshire*; Adelaide d'Orleans, Myriamthes, and Rampante, of the *Evergreen*; Madame d'Arblay, and Rivers's Queen, of the Hybrid Climbing; Anadis, Gracilis, and the old Red Boursault. These, for the purpose you require, are very beautiful.

PAMPAS GRASS AND TRITOMA (*Idem*).—Cutting off the old or last summer's growth very much weakens the former plant, and in a cold situation the *Tritoma* as well, if the winter proves severe. We have known plants cut down killed, while those on which the old foliage was left until spring were not in the least injured. Protect them in severe weather with a little dry litter spread over them, removing it in mild periods.

LATE DUKE CHERRY (*A. McCallum*).—You must have the wrong variety, as the habit of the tree of Late Duke is not the same as that of the Morello. It is more like the May Duke in growth, and the fruit is excellent.

PEAR, CRAB, QUINCE, AND PARADISE STOCKS WORKING (*An Old Subscriber*).—The stocks planted last spring of the thickness of the little finger, will be fit for grafting next spring, but if of less size they would be best left till another year. It is well to have them strong before working. By all means graft those as thick as a man's thumb next spring. Whip-grafting is the best mode. The Manetti stocks should be budded next summer if as thick as the little finger. Bud quite close to the ground, or, indeed, below it, removing the soil about them for that purpose. Indeed, the bark does not part freely from the wood above ground. In planting them cover the junction with soil.

STOCKS FOR WALL, PEAR TREES (*E. M. J.*).—For Pear trees against walls we prefer the Pear stock, but it must be admitted that trees grafted on it do not come into bearing so soon as those on the Quince stock, which, however, ought not for horizontal training to be more than 15 feet apart on a 10-foot wall, and 12 feet apart on a 12-foot wall. We plant those on the Pear stock, and plant midway between each a double upright cord on the Quince. The cordons give us fruit before the others, and we cover the wall on a shorter year. Your climate must be bad indeed for Appricots not to succeed on a south wall. Plums we should prefer to Pears for a south wall; both do very well. Why remove the bloom buds? There will be few on the trees you get, or they will not grow much another year. For walls we like free-growing trees, not those stunted and pinched into early bearing. Your selection of Cherries is good. The fresh leaves will do for ground to be planted with Potatoes, if the ground is naturally rich, and with the guano you will no doubt have a good crop if the season be favourable. Three of the largest prize or Lancashire Gooseberries are—London, red; Leveller, yellow; and Antagonist, white.

ARRANGEMENT OF VINEY (*S. Castle*).—What you do with stages in your greenhouse is just extraordinary of what was referred to a few weeks ago, when speaking of using forcing houses for plant houses and wintering houses in winter. We like the whole so much, that if we made any alteration at all we would lessen the top platform and have more shelves at the back. Then, as that back pathway is 3 feet wide, instead of having one wide shelf over it, if holding numbers of small plants in winter were our object, we would have five or six shelves, say 9 inches wide, against the back wall, and would then borrow a lesson from Mr. Sheppard the nurseryman at Bedford, who uses movable brackets for shelf-supports, taking them out or merely turning them against the wall in summer, when tall plants may be set against the back wall.

VINEY—STOVE FOR PLANT CUTTINGS IN (*H. A. D.*).—For such a house as yours, if you did not mind the appearance, a small brick stove, either near the back wall or the middle of the front of the house, would on the whole be best; say a stove of brick-on-bed 28 inches square, 46 inches in height, a space left for an ashpit, and the firebricks fixed; above them a firebox made of firebricks, 8 inches square and 8 inches deep; close-fitting furnace and ashpit doors; the stove covered at top with a stout flag or a strong iron plate; a short outlet at the side, and a more upright pipe through the back wall or through the glass roof. On the top a vessel of water may be placed. Such a stove would give a more regular mild heat than iron; but with a little care a small iron stove costing from 4s. to 5s. would do for such a house. The chief point is to have a stove with the firebox lined with firebrick, so as to keep the burning fuel from the iron. We have seen a guinea stove that is frequently advertised, in which there is an iron firebox inside, leaving a space all round for heated air, and keeping the fuel from the sides of the stove. The outlet-pipe is at the top, and the top rounded, so that an evaporating basin cannot be used. These stoves are, therefore, better fitted for halls and corridors than for plant houses. We have seen far inferior stoves used safely in little plant houses; but on the whole, to obtain plenty of heat—safe heat—and moist enough if needed, it is best to use a stove with a flat top, and the opening for fuel on one side and the outlet for smoke on the other, and to have a firebox inside, so that the red hot fuel does not abut against the outside case of iron. It is also an advantage when the top can be taken off. We use a stove with a round movable top for lifting up and adding fuel, which with a little contrivance answers admirably; but when we want much heat we have to damp the floor all round it, as we cannot use an evaporating basin. We have an old square stove tied together with stout wires, and a flat movable top, with which we could do wonders. For all such stoves, when taking a horizontal pipe from the side, it should not exceed from 24 to 30 inches in length, coke and cinders are the best fuel, as coal soon clogs up the small pipe used for a chimney.

MANURING VINES (*M. E.*).—We are very sorry that the manure spread as advised at page 493 has injured your Ferns and Cinerarias, and we are rather surprised at it if you gave no more than 1 inch of dressing and left it on. This shows the importance of correspondents being particular, for of two things we were ignorant when giving the advice—first, that the poultry-yard manure was so fresh, and again, that you had Ferns, &c., in the house. If so, and using such dressing at all, we would

have advised doing it early in the day, covering with dry soil or charred refuse, giving more air, and leaving air on for a few nights. You have done the next best thing by covering with soil. We should think the Ferns will spring from the bottom all right, and all the better owing to removing the injured fronds; and so will the Cinerarias, but they will not be so good nor so early. No growing plant will withstand the fumes of ammonia from rank dung. The Pine Apples will endure them better than any plant we know.

VINE BORDER (A Constant Reader).—We should have preferred rather more drainage at the bottom of the border. We would not approve of one layer of fresh dark soil from a pasture and one equal layer of fresh rank manure from the stables. We should expect the border to sink very unevenly, and the Vines, if they succeeded well at first, would be apt to have their roots injured afterwards.

VINES (West Cumberland).—The Vines are not too old to remove to the front of your house, if you desire to do so. It is a pity to throw away such plants, but it is true that there is some difficulty in managing that variety. If you do want a change take either Madresfield Court, which is new, or the Royal Ascot, also new.

RATING NURSERYMEN'S GREENHOUSES, &c. (J. G.).—We reprint the following as you request.—We are of opinion that a nurseryman's greenhouses and his similar structures used exclusively in his trade are not rateable. A nurseryman rents a piece of ground, erects upon it greenhouses, and stocks it thoroughly. The parish then endeavours to rate him to the poor's-rate according to its improved value; and the question has arisen whether this higher rating is admissible. The question was brought before the Winchester bench of magistrates, and was decided by a majority that the higher rating is not maintainable. They held that greenhouses, unlike other buildings erected by tenants in other trades, do not attach to the land, but are always treated in law as stock in trade, which is clearly not rateable. What Lord Kenyon stated in *Penton v. Robert* (2 East 90), is so strongly in support of this view of the case, and is so illuminated by that enlightening policy which should influence a decision upon this question, that we offer no excuse for its quotation:—"The old cases on this subject," said his lordship, "I cannot consider as really (part of the modern) whatever was annexed to the freehold by the occupier; but in modern times the leasing has always been the other way, in favour of the tenant, in support of the interests of trade, which is become the pillar of the state. What tenant will lay out his money in costly improvements of the land, if he must leave everything behind him which can be said to be annexed to it? Shall it be said that the great gardeners and nurserymen in the neighbourhood of this metropolis, who expend thousands of pounds in the erection of greenhouses and hothouses, &c., are obliged to leave all these things behind them, when it is notorious that they are even permitted to remove trees, or such as are likely to become so, by the thousand, in the necessary course of their trade? If it were otherwise, the very object of their holding would be defeated. This is a description of property divided from the realty." Now, if a greenhouse be properly divided from the freehold, it cannot, in the case of a nurseryman, be anything but a part of his stock in trade, which, as we have already observed, is clearly not rateable. The bench were not unmindful of the recent decision in the *Queen v. Haslam* (Justice of the Peace, xv. 23); but they held, though not unanimously, that greenhouses being uniformly treated as part of a nurseryman's stock in trade, the present was distinguishable from that case. Since the foregoing was written there has been a decision of the highest court of appeal in Scotland, determining that a nurseryman's greenhouses and hothouses are removable by him, being only part of his stock in trade. Now the poor's-rate is only assessable upon the rent the land would let for, supposing all the stock in trade was removed. Such is our opinion; but you had better consult an attorney, and have your case tried before a barrister.

POISON IN EVERYTHING (Queen of Roses).—We believe the saying that "there is poison in everything" refers to the fact that everything may be eaten in quantities sufficient to injure health; and when Carrots are excepted, it is because no one could eat them in excess—they do not sufficiently tempt the appetite. If reference is made to the chemical composition of plants, the saying is strictly true, for all plants, Carrots not excepted, contain either sulphuric acid or chlorine, or both, each of which in its uncombined state is a poison. *Silphium erythraeum* has large yellow flowers, and is suitable for a shrubby, growing more than 3 feet high. *Cephalaria tatarica* is like a giant's Scabious, with light yellow flowers. There is a fine collection of flowers in the garden you allude to, but we never inquired anything relative to what you mention.

PLANTS FOR STOVE AND GREENHOUSE (Ignoramus).—*Stove Plants:* *Allamanda grandiflora*, A. Schott; *Alocasia metallica*, *Ardisia cuneata*, *Burchellia repens*, *Cissis discolor*, *Clerodendron Balfouri*, *Croton interruptum*, *C. variegatum longifolium*, *C. pictum*; *Cyrtocarpus reflexum*, *Dalechampia Roeziana rosea*, *Dieffenbachia Pearcei*, *D. Weirii*; *Dipladenia amabilis*, *D. crassinoda magnifica*; *Dracaena ferrea*, *D. stricta*; *Eranthemum pulchellum*, *Echegarhis amazonica*, *Euphorbia jacquiniiflora*, *Franciscia confertiflora variegata*, *F. eximia*; *Gardenia citriodora*, *G. dorida*, *G. radicans major*; *Gesnera exoniensis*, *G. refulgens*; *Hoya bella*, *H. carnosa variegata*; *Imantophyllum minutum*, *Impatiens Jerdonii*, *Xora acuminata*, *I. javanica superba*, *Jasminum gracile variegatum*, *Lasiandra macrantha*, *Maranta illustris*, *M. roseo-picta*; *Medinilla magnifica*, *Polystichia pulcherrima*, *Rogeria gratissima*, *Rondeletia speciosa major*, *Sanchezia nobilis variegata*, *Stephanotis floribunda*, and *Vinea alba*. In the above selection there are some variegated plants. *Greenhouse Plants:* *Aescia armata*, *A. longiflora magnifica*, *A. oleifolia elegans*; *Acrophyllum venosum*, *Aphelexis macrantha purpurea*, *Boronia Drummondii*, *Chorozema cordatum splendens*, *Citrus japonica*, *C. aurantium*, *C. nobilis*; *Cosyposma Baueriana variegata*, *Coronilla glauca variegata*, *Correa Brilliant*, *C. speciosa major*, *Cyclamen persicum vars.*, *Dracaena australis*, *Eriostemon intermedium*, *Erysa latifolia variegata*, *Eutaxia floribunda*, *Gentyllis fuchsoides*, *Hydrangea japonica variegata*, *Kalanthes coccinea superba*, *Lupageria roses*, *Lilium auratum*, *Myrtus communis*, *M. communis angustifolia*; *Nerium rubrum plenum*, *Pimelea decussata*, *P. Hendersonii*, *Polygala Dalmanisiana*, *Rhododendron jasminiflorum*, *R. Princess Royal*; *Rhynchospermum japonica*, *Statice profusa*, *Tremandra ericifolia*, *Vallota purpurea*, *Veronica Andersonii variegata*, *Camellia*—*Alba plena*, *Bealii*, *Fimbrata*, *La Pace*, *Madame Lebois*, *Mathotiana*, *Mrs. Cope*, *Napoleon III.*, *Rubens*, *Storyi*, *Valteverde*, and *Wilderi*. *Azaleas*—*Brilliant*, *Cheloni*, *Criterion*, *Duc de Nassau*, *Etoile de Gand*, *Extranei*, *Gledstanesi formosa*, *Mars*, *Queen Victoria*, *Stella*, *Vesuvius*, and *Wilhelm Lester*. *Epaerises*—*Hycinthiflora*, *Lady Pan-*

mere, *Viscountess Hill*, *The Bride*, *Alba odorata*, and *Eclipse*. Probably we have named too many, but when at the nursery you can select those you like best. For the greenhouse you will need *Primulas*, *Calceolarias*, and *Cinerarias*, but these you can raise from seed. We have not named *Gloxinias* and *Achimenes* for the stove. You will need some of each, and, no doubt, *Adiantums*.

GLAZING (S. M.).—If you make your grooves deep enough to give from one-eighth to one-fourth of an inch play for expansion at the sides, and with your incline you need not fear drooping, nor cracking if the glass is nicely cut.

MIXING LEAVES WITH FARM-YARD DUNG (J. T. S.).—One ton of farmyard dung mixed with an equal quantity of fresh leaves, if laid up until spring, and turned over twice or thrice, would make a good dressing for strawberries, and may be dug in now for crops of the Cabbage tribe. Of their value separately, there is no question that one ton of the farmyard manure is worth two of the leaves. Throw them up in a heap, sprinkling them with water if at all dry, and turn them over again in about ten days, watering well. They will need another turning in about three weeks, and in about three more they will be fit to put on the land. If you want the manure short, fully three months are required.

LAWN PATCHY (A Constant Reader).—Your best plan would now be to fill up to the level the holes scratched by the poultry, and let the lawn alone until the beginning of April; then rake it over, making sure that the surface is quite even, and sow some grass seeds over the bare places. If the weather is dry roll well, but if wet leave it, for if you roll whilst the lawn is wet the grass seeds would probably adhere to the roller, and so be moved from the bare places. If the whole lawn is thin of grass, in addition to sowing thickly over the bare places scatter a few seeds over the rest, say from 12 lbs. to 20 lbs. per acre, along with 8 lbs. of *Trifolium minus*.

HEATING WITH HOT WATER (J. Everaerts).—We think you make a mistake in dividing the yards by 20 instead of the cubic feet of the building, for then you will find that nearly three times the quantity of piping will be required. We can vouch for the rule being nearly correct as respects glass houses; but the less the cubic amount of air contained the more piping in proportion should be used. The large conservatory at Chatsworth is heated by dividing the cubic feet of air by 30, and allowing 1 foot of 4-inch pipe for every 3 cubic feet of air. For a lower house, dividing by 20 would be safer; 30 should be the divisor for lean-to houses where a medium of from 55° to 60° is required. When higher temperatures are wanted the divisor should be 25, and down to 18 and lower. Low span roofs would at least require one-third more piping. The rule is given for feet, not yards or inches.

PLANTS IN A ROOM (J. T. W.).—The Ferns will do tolerably well, and also the ornamental foliaged plants; but only near the windows will either long remain healthy.

PLANTING RED CURRANTS (J. F. C.).—We neither approve of Black, Red, nor White Currants being planted deeply so that their branches are layered, so to speak, in the ground. Larger fruit may be in some cases produced, but it is from the new wood that is sent up from the base, and these suckers soon become troublesome. We like every bush to have a clear stem, no suckers below the setting-on of the branches, and we invariably have fine fruit. We have no doubt that in light soils the planting so as to cover the lower parts of the branches is good, but they soon become little beyond suckers—stools, in fact.

HELIOTROPES (Idem).—There are no better dark Heliotropes for bedding purposes than the two you name. Monsieur Hamaire is a fine large purple, fine for winter flowering, and Surprise is a very fine dark sort. H. Voltairinum we suppose you have. It is a fine dark sort.

NAMES OF FERNS (Idem).—No. 1 is *Nephrolepis davallioides*. The atria roots extending over the pot are not a sign of its requiring potting, though when they are very abundant the plant must be growing freely, and would profit by a shift. We have had plants 12 feet across, and fronds over 6 feet in length. It was in an 18-inch pot, standing on sandstone rock, over which the aerial roots extended in all directions. Under good cultivation it makes a very handsome specimen. Pot it in rough brown peat, with plenty of sand and good drainage, and water freely. No. 2, *Gymnogramma tartarea*.

NAMES OF FRUIT (William Kemp).—*Pear*—2, *Beurré d'Arenberg Apples*.—1, *Wormsley Pippin*; 2, *Bradley's Nonpareil*; 4, *Dumelow's Seedling*; 5, *Winter Hawthornden*; 7, *Autumn Pearmain*; 8, *Wyken Pippin*; 13, *Norfolk Colburn*; 14, *Count-pendula-plot*; 15, *Kerry Pippin (Charlottenes Gildes)*.—A, not known; B, *Beurré Bachelier*; C, *Eldon Pippin*; D, *Beurré Six*; E, *Beurré Schidweiller*; F, *Vaner* of Wickfield; G, *Beurré Diel (E. W. Russell)*—*Passé Clair*. (Col. Harcourt).—*Glou Montan*.

NAMES OF PLANTS (J. Whittaker).—Your Orchid cannot be named unless we see one of its flowers.

POULTRY, BEE, AND PIGEON CHRONICLE.

AWARDS—TRIMMING.

I REGRET much that ill health prevented my replying to Mr. Hewitt's last letter the week after its appearance in these columns; and since then both myself and the Journal have been so much occupied with more pressing matters that I have not till now been able to do so.

What strikes me most throughout Mr. Hewitt's letter, perhaps, is the singular want of a looking at any of the questions spoken of in their real or general aspect, but instead thereof dealing with them as if they were entirely personal between him and myself—as if I individually were simply endeavouring to force more work upon him individually, which he in self-defence was bound to resist. Such was not my intention. I did not even wish or expect to extort from him a second reply

at all, as I can well imagine his extensive correspondence. I cannot accept his proposal to take his place and judge a show of five hundred pens, for reasons of which the following must suffice:—1, It is one of my peculiar opinions that no one possibly can judge five hundred pens as they ought to be judged. 2, There are breeds which I do not, and never pretended to, understand; and there are many who might, perhaps (I do not say they would), accept my judgment in regard to Brahmas, Cochins, and some other breeds, who would feel justly aggrieved were I called upon to pronounce upon their Hamburgs or Game fowls. 3, While Mr. Hewitt's time is his own, mine is not, and it is only on rare occasions that even my health would allow of my performing such an office. Mr. Hewitt cannot have known these things, or his appeal would bear an unworthy aspect of which I know him to be incapable; but he ought, perhaps, to have sought a little information on them before making it.

I can assure him the difficulties of a judge are no mere myths to me: I should get no new light on that subject, and all the rest would remain where it was. Whether a certain point raised by me is desirable or not to be adopted, is one general question which should be argued solely on its own merits. Whether, if adopted, it would further tax the judges; and if so, how overtaxing them can be avoided—that is another question. The one is certainly related to the other—that I admit; but it does not settle it; for the same argument would have prevented the dividing the sexes at Birmingham, the giving of four prizes (which Mr. Hewitt himself recommends) much less six, and many other desirable reforms which all demanded more time, but have been adopted nevertheless. How the increased labour may be lightened is a point on which I hope to say more at a future time.

Having thus disposed of one of his appeals to me, and of the time objection, only one argument is left. He says, if I "only want a close idea of the state of the competition," this is "fully met by a glance at the number of pens highly commended." That is very all I did want, or had in view; but his assertion a simple reference to a file of this Journal will show to be incorrect. I have repeatedly remarked reports of shows (sent by the judges themselves) stating that classes were of unusual or even "extraordinary" merit throughout, yet with only one or two commendations; while, on the other hand, instances occur where the distinctions are thick, yet the class is pronounced poor! The reason seems to me to be, that merely "highly commended" is too indefinite, and may mean almost anything; hence—and for no other reasons—I proposed some higher award to have some definite value. The diploma I mentioned in my second letter was not meant as a "new" proposal, and Mr. Hewitt should not have so stated it. In fact, the name is of little moment; and to show that nearly everyone but Mr. Hewitt seems to have understood me, and that my suggestion did receive some little "favour at the hands of committee," I received almost by next post several letters of high approval, two of them from secretaries of shows, one of whom suggested medals as better still. Since then I have had a schedule sent me, in which the 1st prize is an embossed card. I want something higher and more definite than mere "highly commended," that is all. What it is, so it fulfil these conditions, I care little; and why, after I had for the present given up the point of order of merit expressly on account of his protest, Mr. Hewitt should apparently fasten on this very acquiescence as a fault on my part, and accuse me of changing my "ground," I cannot quite understand. I can only say, now that several weeks have passed, many letters of approval I have received confirm my opinion that some intermediate award—whatever it be called—is greatly needed, and already the prize lists in the Journal show that one judge (at Newport) has adopted it.

On the trimming matter my remarks will be very brief. I have been shown, years ago, Bantam tails put in as cleverly as any seen now, but they were not found out. Men were quite as clever then as now, but only the ruder cases seem to have been detected. I must add, however, that much of what I wrote on trimming was directed more against shameless plucking—whether of hocks, hackles, body feathers, or tails—which judges can detect and punish if they choose, than against the rarer cases of deeper art. Cases almost impossible of detection, it is no discredit to the judges seldom to detect; but since Mr. Hewitt so personally challenges me and my opinions, I say deliberately and emphatically, that in my opinion the judges should not have given prizes to birds like many of the Cochins cocks at Birmingham, with the whole of the tails notoriously and shamelessly torn away. There was

no concealment there. This, therefore, is a barefaced fraud, for the toleration of which there is no excuse; and when I hinted at certain "results" of my labour, I had chiefly in mind the notorious fact that plucked hocks used also to win prizes with impunity, but very rarely do so now. I am confident I shall see the time yet when plucked tails will share the same fate. I was very glad to see Mr. Hewitt this season join in giving prizes to decidedly hooked birds of merit when honestly shown; and he must allow me to believe that this and other objects I have at heart are more likely to be realised by my working in my own way than in that he suggests for me.

I quite admit the want of time to detect many of the "finer branches" of trimming. My original proposal was, therefore, that any such discoveries after judging should still disqualify. I yet believe this to be the only remedy.

I have only to say in conclusion, that regarding the "protestor" who was disqualified, I did not say it was an injustice to "refer to such an enormity." The injustice I feared had been done, was in a mistake as to the fact, not in referring to the matter. In asking for the names, I had no thought of requesting their publication, but only that they might be given me; but on reading over my own letter, I am bound to admit that the language of the request will fairly bear the construction Mr. Hewitt put upon it, and I cannot, therefore, complain.

The remaining portion of his letter, on buying prize pens, relates to a question not raised by me, and with which I have nothing to do. I hope shortly, however, to say a few words upon difficulties and mistakes in judging, and their remedies. On these matters I trust Mr. Hewitt and myself may find more agreement, and I quite coincide with him in the opinion, that on behalf of the judges also, who so kindly give their aid to the fancy, mostly without charge, and too often without even thanks, much, very much, indeed, needs alteration for the better in the arrangement of our shows.—L. WRIGHT.

OILING THE PLUMAGE OF EXHIBITED BIRDS.

WHEN people be never content to exhibit their birds fairly without in some way or other tampering with their plumage? In some cases out of ten the dishonesty is at once detected, but supposing it to be overlooked, and a prize gained, what a paltry recompense when honour is endangered! One of the latest "tips" in plumage-doctoring is to oil birds' hackles with intent to make them appear darker than they actually are. The case in point occurred not long ago at one of our leading shows. A pair of Brahma pullets were noticeable for their dark hackles, so much so that one of the judges on meeting the owner asked what had been done to them. The reply was that they had been oiled. Now, I will not mention our friend's name, as I fear I should damage his reputation by so doing, and I merely wish to give him a timely warning, which I hope he will take in good part, to avoid such trickery for the future. If "Nemo" had the handling of him I could not be answerable for the consequences.—NEMESIS.

WHITE BANTAM CLASS AT MANCHESTER SHOW.

HAVING no more subscriptions to record, I beg to say that the prizes in the above class will be—1st, £2; 2nd, £1; 3rd, 10s. Subscribers' names have already appeared in this Journal. This sum is the amount of subscriptions received.—SAML. J. ASHTON.

RAILWAY NEGLECTS.

I HAD been anxiously looking forward for the last three months to the Crystal Palace Poultry Show, and at the proper time I sent ten entries for Dragons, for which I paid £2 15s. The birds left here (Birkehead), by the 11.40 train on the Monday morning previous to the Show, and should have been delivered the same evening. Almost every bird I sent had won prizes at some of the principal shows, and I consequently believed my chance to be second to none for at least one of the cups; judge of my surprise on receiving a list of awards, not to find my name even among the commendeds. On Thursday I accidentally heard my birds did not arrive until too late for the judging, which took place late on Tuesday; in fact, they did not arrive until Wednesday. I do think the Secretary of the Show is to blame in not writing me when he found they had not arrived, even on the Tuesday, so as to allow me to make some inquiries as to their whereabouts. I suppose if

they had never reached their destination I should have been left in ignorance. I have good proof that if they had been there in time I should have won one if not both of the cups offered for Dragoons. Have any of your readers been in the same fix, and did they obtain any redress from the railway company? I shall be very glad of any experience on the subject, as I intend suing the railway company for my loss.—FRANK GRAHAM.

CRYSTAL PALACE POULTRY SHOW.

THE birds were carefully tended, but I must express my own opinion—not a solitary opinion—I am very certain that pens with wire backs and fronts are an abomination. It was almost impossible to make any bird face you, and thus, judging must have been more difficult; or if the birds did face, they backed against the wires to the great damage of their tails. Most of the pens, however, had another serious fault; for the large breeds they were neither high enough nor large enough. Many a Dorking cock looked as if he had a wry tail, simply because he had no room to carry it properly. So, again, one or two of the Malay cockerels did not show themselves off from want of height in the pen. I believe the pens used were those of Mr. Billett, and have been lauded in "our Journal," but for many breeds they are decidedly too small. I heard much grumbling, and some talk of a protest being set on foot; however, I trust that there will be no occasion for such a course.

My chief object in noticing the Exhibition is to give a little analysis of the entries, which may prove useful to schedule-framers and committees. I have often before in our pages urged the desirability of making classes for all breeds at all established shows; they may not always fill, but they always add an attraction to visitors, and make a variety.

In the following table I have endeavoured to show the number of entries in each class, the amount of prize money offered, adding to each class a share of the silver cup offered between them, and in the last column the amount that the entries produced. I put them in two divisions, in the order of the catalogue, the first division being those that repaid the exchequer by entries, the second those that failed to do so.

FIRST DIVISION.

	Entries.	Prizes offered		Amount entries produced.	
		£	s. d.	£	s. d.
1. Coloured Dorking	74	16	10 0	27	15 0
2. Dark Brahma	75	17	5 0	28	2 6
3. Light Brahma	91	21	15 0	33	15 0
4. Houdans	59	19	5 0	14	2 6
5. Other French varieties	29	8	0 0	10	17 6
6. Gold-spangled Hamburg	20	6	1 0	7	10 0
7. Gold-pencilled Hamburg	21	6	1 0	7	17 6
8. Silver-spangled Hamburg	22	6	1 0	8	5 0
9. Black Red Game	47	19	15 0	17	12 6
10. Golden Polands	15	3	10 0	5	12 6
11. Silver Polands	12	3	10 0	4	10 0

SECOND DIVISION.

1. Silver-Gray Dorking	40	13	11 0	15	0 0
2. White Dorking	14	6	11 0	5	5 0
3. Buff Cochins	27	16	15 0	10	2 6
4. Partridge Cochins	24	16	15 0	10	10 0
5. White Cochins	15	6	5 0	5	13 6
6. Spanish	70	33	12 0	26	5 0
7. Silver-pencilled Hamburg	14	6	1 0	5	5 0
8. Black Hamburg	15	6	1 0	5	12 6
9. Brown Red Game	19	10	15 0	7	2 6
10. Duckwing Game	25	14	15 0	9	7 6
11. White-crested Black Polands	6	3	10 0	2	5 0
12. Malay	9	3	10 0	3	7 6

Now, can we gather anything for future arrangements from the experience of the great London show? Clearly the first division deserve every encouragement, not because they are more useful, not because they are more beautiful, not because they are the hardest, but in the eyes of Committees, simply because they return their prize money. Is this the end, the one object of our poultry exhibitions, many of which are said to be formed for the encouragement of the breeding and improvement of domestic poultry? Or rather should not the prize money be so meted out as to encourage as much as possible all the established breeds, that either for hardness, beauty, use, or special peculiarity, have more or less their admirers? I submit the latter is the right course.

The eccentricities of entries are marvellous. Why Buff Cochins should turn out in such miserable numbers at the Crystal Palace, nobody knows or will know. Why Brown Red Game should be eclipsed in numbers by the Duckwing tribe is

another mystery. Why Golden Polands, that a year or two ago appeared "polled out," should come with a rush and distance the Silvers, is inexplicable. All this only proves that in the outset of framing a schedule no Committee, however shrewd, can declare which breed will enter best.

We have two other really grand shows coming off; we have Bristol and Clifton, with no Malay class, and Polands all lumped together. This, I contend, at such a show is most unfair, and I trust it will be the last time such a course will be pursued. Manchester is as bad in this respect, and is very peculiar in one or two other points. What has happened to the prizes for Hamburgs? the division is most strange. No Malay class, and Polands all lumped together! I am far from desiring that every little exhibition should sub-divide its classes to a great extent, but I do contend that at grand shows, where a large collection of poultry may be expected, the breeds I have mentioned should be offered a separate class. The experience of the great London show abundantly proves that they will enter fairly.

One word more. I venture to say that for the shows themselves the division of sexes is a mistake, at any rate for the less popular classes, and that for practical purposes the cock and one hen will avoid the difficulties of matching, and give a greater probability of entries, while causing a far smaller drain on the exchequer.—Y. B. A. Z.

THE USE OF STICKS AND UMBRELLAS AT POULTRY SHOWS.

At the late Birmingham Show I exhibited four pens of birds, and although they were not considered worthy of a place in the prize list, they were of sufficient merit to have taken prizes at several shows. On Monday, November 28th, I saw them and they were all right; on Wednesday I again visited the Show, and was informed by a friend that one of my pullets could not stand, and that my man had unsuccessfully endeavoured to raise it. I immediately drew the attention of the attendants to it, who did all they could, allowing me to send it home, where it now is much in the same condition. I have little doubt as to the cause, which would suggest itself to anyone who saw, as I did, persons poking and stirring-up birds with a stick with iron on the end. I believe, in the case of my bird, a probe on the hip-joint is the cause of the lameness. I am not alone, for one of our largest exhibitors and most frequent prizetakers, has now a bird—a cock, with his comb injured by a stab, whether wilfully done or otherwise, I cannot say. At nearly all exhibitions the public are prohibited taking sticks, umbrellas, &c., why not at poultry shows? I contend that the value and comfort of the birds ought to be taken into consideration, rather than the gratification of spectators, many of whom may ignorantly injure a bird, while others with a better knowledge, but a worse spirit, may take the opportunity of removing from the field of exhibition a bird which has been, and would be, a successful competitor.—J. H.

WEST OF ENGLAND POULTRY SHOW.

(From a Correspondent.)

THIS Show, held at Plymouth on the 13th, 14th, and 15th inst., exceeded by far any of its predecessors both in numbers and quality, and it may be perhaps considered the best exhibition seen so far west for many years.

GAME, Black-breasted and other Reds.—First-prize a cock of beautiful colour, hen not so good; second-prize cock hardly large enough, but otherwise a most perfect bird—indeed, the Judge considered these pens equal to anything shown at Birmingham. A very fair pen of Brown Reds was shown in this class by mistake, otherwise it would have been third. The remaining birds were fair average specimens.

In the *Any other Variety* class the first three pens were of good colour, and shown in perfect condition; the rest were not so creditable. The first prize birds were certainly out of condition.

Of Single Cocks the first-prize was a clean, tight, handsome bird, shown marvellously well. Pen 52, shown by the same exhibitor, would have stood higher had he not been too much spoiled by fighting.

In *Indian Game* the first and second-prize pens were creditable, although the whole class exhibited strong traces of the Malay.

DORKINGS.—This class was first-rate throughout. The first-prize winners were good in frame and feet; the second not so good as regards the cock; the third hardly so good as pen 94 (very highly commended). The cock's comb had an excrescence on either side. All the noticed pens were bad in the feet.

COCHINS.—Buffs.—In this class the birds were badly matched throughout, and in all cases the cocks were inferior to the hens, which

were as much superior as the former were weedy. The first-prize pen contained a grand hen of capital colour; the cockerel mated with her was perfect in this respect, but far too small. The second-prize birds were out of place and not so good as the third, which were large and heavily feathered, but more neatly in colour.

Partridge.—A very good class. The first, second, and cup birds were remarkably good. First a good bird, well-shaped, good in colour and feather; hen first-class. The second-prize cock was of fine shape and superior to the first-prize one, but mated with a weedy pullet not at all worthy of a place in the prize list. Third-prize birds large in frame, but slightly red in the thigh and badly shaped in the back. Pen 121, winner of last year's cup, displayed too much white in the tail to place him again in the prize list. The cocks were superior to the hens throughout the class.

White.—A remarkable class and badly judged. Excepting a pen of very filthy chickens the whole of the birds were of excellent quality. First, a very white cock of very fair shape, but too large in comb and too full in tail; the hen, although good, was far inferior—indeed, the pair weighed fully 6 lbs. less than three or four other pens. Second, a somewhat similar pen to the first, clean and white, but neither so large in frame nor the cock so well feathered. The third-prize pen contained a grand hen, white as snow and nearly perfect; cock a very fair bird. Pen 127 (highly commended), contained a superb hen, large, clean, and well-feathered, but mated to an inferior cock. Either of these pens was superior to the winning birds, as also was an unnoticed pen, 132, containing by far the grandest-shaped cock in the class, with a perfect comb, tail, and hook; the hen with him was also a high-class bird. It was very noticeable in this class, also in Light Brahmas, that every pen was passed over by the Judge where the plumage was at all soiled, entirely disregarding the merits of the birds; although some were "dirty" throughout the two classes, and in spite of the awards, we have yet to learn that a pen to win must be so miraculously clean.

Brahmas.—*Light.*—A really capital class, and the best ever seen in Plymouth. The cup pen was most decidedly a mistake, the pullet being small and unworthy of her position. The cockerel was, however, a good bird, grand in carriage and colour, but too arched in the neck, well pencilled, and certainly small. Second a heavy bird, poor in tail and pencilling, with only a moderate hen. The third-prize pen contained the best hen in the class, large, heavily feathered, and prettily pencilled. The cock was, however, far too poor; indeed, there were two or three pens decidedly superior in points to those which had the second and third prizes. An unnoticed pen (No. 139), brother and sister of the cup-winners, if judged by points alone, should have stood first, both being larger birds; the cockerel, perhaps, not so good in carriage, but equal in every other respect. These cockerels far surpassed everything else in the class, and will be heard of again, almost equalling any other birds of the year.

Dark.—Thirty pens competed in this class. The first-prize pen was well judged, both birds good in colour, grand in shape and size, and were soon claimed at £6. The second-prize pen was also good, but by no means equal to the winners in colour or size. Vulture-hooked birds were numerous, including the third-prize cock, which we think a mistake; Mr. Beachy's commended pen, also No. 164 (highly commended), being preferable.

Polands.—This was a very poor class both in number and quality. Mr. Pickles was first with a pen of Silvers, much overshown and scarcely able to stand in the pen. Second, fair Golden; third, White-crested, and the most deserving pen in the class. With the exception of an unnoticed pen of Silvers, the remainder were poor.

Spanish.—A poor class throughout. With the exception of the first-prize cock there was not a first-class bird; he, however, was really a high-class bird, and, mated with a better hen, would have taken the Society's cup. Second and third only fair pens, but they will show better before long.

Hamburgs.—*Golden-pencilled.*—Mr. Barter was first and second with first-rate pens, good in comb, tail, and earlobe, and of capital colour; in fact it was difficult to choose between them. Mr. Pickles was third with a moderate pen much overshown. The remainder were nowhere, the combs being particularly noticeable from their inordinate size. This was a large class.

Silver-pencilled.—Mr. Pickles was first with a fine pen perfect in all points. The second-prize pen was only inferior in colour, running the winners very closely; the third was also a good pen. The others were decidedly poor.

Golden-spangled.—The winning pens were such as are seldom seen in the West. The first were simply perfect; the second and third little inferior. The remaining pens were all poor, the majority being much overgrown in the comb.

Silver-spangled.—This was a wonderful class, both in numbers and quality, and nothing like it has ever been seen west of Bristol. Mr. Barter's first-prize pen took both the Hamburg and Society's cups. They were almost perfect. The second-prize pen was first-rate, but the hen's comb was slightly hollow, and she was a little too heavily spangled. The third and all the noticed pens decidedly good. Mr. Pickles's pen would certainly have been in the prize list but for the white face of the hen.

Bantams.—*Game.*—This was a large and good class. The first-prize cock was a little beauty, but slightly striped in the hackle, and the pullet too mealy on the wing, otherwise the birds were first-rate.

The second-prize birds were a very fair pen, but larger than the first. Third, Duckwings, good in colour, and thoroughly Game. By far the best pen in the class, No. 285, was unnoticed, the pullet showing stumps of feathers down the legs; the cockerel was almost matchless, and such as is very rarely met with; in every other respect the pullet was fully his equal. This cockerel will, doubtless, be heard of again.

Any other variety.—This was a poor class, and without one thoroughly good pen. The first and third-prize pens were moderate Black; the second fair Golden Sebrights. A pen of Silkies was fully equal to either of the winners, also a pen of Laplands, the cock, however, was deficient in crest.

ANY OTHER VARIETY.—A very good class. Houdans were first; the hen very old, but a capital bird in every respect. The cock was too dark and short in one wattle. Second, a fine pen of Crève-Cœurs, good in crest and colour. Third only moderate Black Hamburgs. Miss Williams's pen of Crève-Cœurs, which we think could not have been seen by the Judge in consequence of their removal to a larger pen, were the best in the class.

THE SELLING CLASS mustered forty-five pens, and contained some very cheap birds. A pen of very fair Dorkings was first; Light Brahmas second, the cockerel a grand bird, but light in neck; third, a nice pen of Game.

THE DUCKS, GESE, AND TURKEYS were not first-rate. First-prize Aylesburys were heavy, but dirty, bad in bill and feather, and very clumsy. Second not so heavy, but otherwise very good, and an easy first in all but weight.

PIGEONS.—The first-prize *Carriers* were bad in eye and wattle, and although claimed at a high price, we think a mistake. Mr. Yardley's commended pen was very poor, coarse in wattle, and poor in eye. *Tumblers* and *Fantails* were very good, and well judged, both first-prize pens being excellent. *Barbs* and *Nuns* were good in the prize birds. *Jacobins* were not first-rate. *Pouters* were simply a farce, there not being a real Pointer in the Show.

The chief blot of the Show was owing to the pen-contractor, many of the pens being only of the proper size for a pair of Pigeons. In the Any variety class many birds could not stand upright, and the beautiful pair of Houdans which took the first prize literally could not move, and must have suffered horribly.

There were many single birds in all the classes of very great merit, but too often badly matched. In several cases exhibitors of the large breeds showed birds which, if the best had been put together, would have commanded the first prize.

GAME.—*Black-breasted and other Red.*—1, C. H. Martin, 2, N. Barter, Plym. 3, E. A. Adcock, 4, J. Doney, 5, R. Hickam, *Indians*—1 and 2, Mrs J. J. Richards, 3, Bow, 4, J. Palmer, 5, J. Bower, J. Jasper. *Any other Variety.*—1, E. Martin, St. Austell, 2, J. H. Reynolds, Truro, 3, E. C. Pope, Falmouth, 4, R. Dawe, T. Hawken, J. Hoyt, F. Westlake, 5, E. S. Higham. *Cock.*—1, J. Harris, Liskeard, 2, E. C. Pope, 3, Dr. Bullock, Falmouth, 4, E. C. Pope, 5, R. S. Higham.

DORKINGS.—1, E. Burton, Truro, 2, R. W. Beachy, Torquay, 3, W. Brown, 4, Mrs. Wolcombe, Stowford Rectory, 5, Mrs. Thynne, J. Ward, W. Trevithick, E. Barton, 6, W. Brown.

BRAHMAS.—*But or Cinnamon.*—1, S. R. Harris, St. Day, 2, Mrs. Wolcombe, 3, W. Masland, Milverton, 4, he, and 5, Mrs. Wolcombe, 6, G. Widger, J. Midway, T. M. Hawke. *Partridge.*—1, Cup and 2, J. Beard, St. Blazey, 3, J. Long, Plymouth, 4, J. H. Nicholls, 5, W. Beckerley, E. Cornelius. *White.*—1, F. Rogers, Bristol, 2, T. M. Hawke, 3 and 4, F. Brewer, Lostwithiel.

BRAHMAS.—*Light.*—1 and Cup, H. T. Pearce, Tonnass, 2, P. D. Maddox, Launceston, 3, J. H. Nicholls, Lostwithiel, 4, Mrs. Wolcombe, 5, Mrs. Wolcombe, Rev. J. Bailey, 6, W. Masland. *Dark.*—1, R. W. Beachy, 2, J. G. Price, 3, J. H. Read, 4, E. Burton; F. Seccombe, 5, H. Eurt; E. Cornelius; Mrs. Thynne; F. Seccombe.

POLANDS.—1, H. Fickles jun., Farby, 2 and 3, T. Jacobs, 3, J. Beard.

SPANISH.—1, G. Toukam, Bristol, 2, J. H. Read, Colstock, 3, J. Gildion, Bristol, 4, J. H. Nicholls.

HAMBURGS.—*Gold-pencilled.*—1 and 2, N. Barter, 3, H. J. Fickles, *Silver-pencilled.*—1, H. Fickles jun., 2, 3 and 4, N. Barter, *Gold-spangled.*—1 and 3, J. Midway, Newton Abbott, 2, N. Barter, *Silver-spangled.*—1, Cup and Society's cup, N. Barter, 2, Miss E. Browne, Chard, 3, E. Newton, 4, S. Newick; J. Woodley; S. R. Harris; Miss E. Browne, 5, S. R. Harris.

BANTAMS.—*Game.*—1, N. Barter, 2, J. H. Glossop, Weston-super-Mare, 3, J. Pearson, 4, T. Jacobs, Newton Abbott, 5, E. Burton; J. Callacott, Tavistock.

ANY OTHER VARIETY.—1, F. Brewer, 2, N. Barter, 3, C. Drake, Ipswich, Lostwithiel, 4, E. Burton (Minceas); J. Long, 5, P. D. Maddox (Houdans).

SELLING CLASS.—1, F. Seccombe, 2, H. D. Pearce, 3, S. N. Davey, 4, P. D. Maddox; W. Humphreys, Liskeard.

DUCKS.—1, J. H. Nicholls, 2, T. E. Hawken, *Rouen.*—1 and 2, J. H. Hoyt, 3 and 4, E. Burton, *White Aylesbury.*—1, S. R. Harris, 2, T. E. Hawken, 3, S. R. Higham, 4, F. Brewer; F. Seccombe; B. Slaughter.

GESE.—1 and 2, F. C. Ford, Plymouth.

TURKEYS.—1 and 2, J. B. Parsons, Launceston.

PIGEONS.—**CARRIERS.**—1, J. H. Glossop, 2, W. H. Mitchell.

TUMBLERS.—1, T. Chudley, 2, E. Barton.

FANTAILS.—1, H. Yardley, 2, S. Richards.

ANY OTHER VARIETY.—1, H. Yardley, 2, F. Brewer.

Mr. Fielding judged the *Game, Hamburgs, Bantams, and Ducks*; Mr. L. Wright the *Dorkings, Cochins, Brahmas, Polish, Spanish, and Any other variety*; and both the Judges together the *Selling Class*.

REIGATE POULTRY SHOW.

This was held on the 13th inst., when the following awards were made:—

LOCAL CLASSES.

DORKINGS.—1, Ivory & Son, Dorking, 2 and 3, E. T. Bennett, Betchworth. *Chickens.*—Special for best pen of Dorkings in the show, 1 and 3, Ivory & Son, 2, G. Ellis, 4, E. T. Bennett, 5, G. Allen, Euckland; J. W. Taylor. *White.*—1 and 2, Mrs. Jaffray, Betchworth, 3, J. Clutton. *Chickens.*—1 and 2, Mrs Jaffray, 4 and 5, P. Hanbury, Redhill.

SPANISH.—1, 2, and *hc*, Francis May, Reigate. *c*, E. Ritherden, Reigate. *Game*.—1, W. Oakley, Oxford. 2 and *hc*, P. Hanbury. *Chickens*.—1 and Cup for best pen of Game in the Show, and 2, J. Mew, Reigate. *hc*, W. Oakley; J. Clifton; J. Mew.
BANTAMS.—*Game*.—1, H. J. Jones. 2, P. Hanbury. *hc*, H. Simmonds; J. Mew; Mew, Brothers. *c*, W. Oakley. *Any other variety*.—1, P. Hanbury.
COCHINS.—1, A. O. Wilkinson. *hc*, P. Hanbury; A. O. Wilkinson.
TURKEYS.—1, W. C. Gyles, Reigate. 2, J. W. E. Matthews, Chipstead.
POULDS.—1, Sir H. A. Glass, Ashurst. 2, G. Simpson. *hc*, W. Oakley.
GEES.—1, W. J. Taylor. *hc*, J. Selmes. *Goslings*.—1, W. Heusman, Oxford. *hc*, H. Wise, Brockham.
DUCKS.—*Any*.—1, W. Oakley. *Ducklings*.—1, Mrs. Jaffray. *hc*, Mrs. Jaffray; G. Allen. *Toucan*.—1, G. Simpson. *hc*, Ivery & Son. *Ducklings*.—1, Ivery & Son. *hc*, W. Oakley. *Any other variety*.—1, T. Hanbury. *Ducklings*.—1, J. Clifton. *hc*, P. Hanbury.

JUDGES—Mr. Headley and Mr. Wood.

LEEDS POULTRY SHOW.

UNDER the management of Mr. Swales, who is one of the most obliging of honorary secretaries, and a very attentive committee of management, the Leeds Show annually becomes more and more popular; the collection of poultry, Pigeons, and Rabbits shown on the 13th, 14th, and 15th inst., being a great improvement over those of years gone by. The attention paid to the comforts and necessities of the birds exhibited was all that could be desired.

Very rarely have such good classes of *Game* fowls been brought together at any show, the only drawback being the great difficulty experienced by the Judges in taking out any of the birds for the purpose of close examination, as the front wirework ran the whole length of the row of pens. The silver cup for Game fowls was taken by an excellent and well-shown pen of adult Duckings. A considerable proportion of the *Dorkings* were evidently much the worse from being too frequently exhibited; a few pens that were decidedly "ronny" appeared in this division of the Show. One of the most perfect varieties of poultry shown were the *Spanish*; in fact, there was scarcely a pen of anything like inferior quality in the whole lot. This season's birds proved to be the winners of the cup. Some extraordinarily good *Cochin* and *Brahma* fowls were shown, but not in the condition for exhibition that might at this season be reasonably expected. In Class 42. Any variety of *Cochin* chickens, pens 422 and 423, being the first and second-prize pens, were so evenly balanced as to quality that the Judges were long in bringing their award to a conclusion. It was the closest run seen for many years. The *Hamburgs* fully supported the high repute of the district, and the classes throughout were unexceptionably good; a remarkably fine pen of Golden-spangled chickens took the cup. The *Polish* was all shown together, and such a display is but rarely to be seen anywhere. Blacks with white crests took the first prize, and the Golden and Silver-feathered were scarcely less worthy of note. In the "Variety class," *Crève-Coeurs* and *Hondans* divided the prizes between them. Among the *Game Bantams*, a pen of perfect Brown Reds took the cup, being more correct in feather than any that have yet been exhibited. The *Waterfowl* and *Turkeys* were a first-rate collection, Mr. Burn's pen of *Buenos Ayrean Ducks* that took precedence, being in such show-trim as is rarely equalled.

The *Pigeons* were better than have ever before been seen at the Leeds Show, but were placed far too high for general inspection, this tier being raised some 8 or 9 feet from the ground, so that ladies, particularly, could scarcely get a glimpse of them. As this portion of a show is usually one of the most interesting to visitors, an alteration in the arrangement in future years would be most advisable. Carriers took the silver cup for the best pen of Pigeons exhibited.

At least equal to that of any former year, if not in excess, was the attendance on the first day of opening to the public, and on the following, we are informed, so well filled was the Show that it was difficult to move about.

GAME.—*Black-breasted Red*.—1, J. Laming, Spalding, Lincolnshire. 2, H. M. Julian, Hull. 3, J. Firth, Chatsworth, Bakewell. *hc*, C. W. Brierley, Middleton, Manchester; W. Harker, Cottingham, Wngley. *c*, J. Superland, Halifax. *Chickens*.—1, C. W. Brierley. 2, H. M. Julian. 3, J. Harker, Alerton, Bradford. *hc*, Barker & Charnock, Ilmington, Halifax; G. Ducker, Leeds; J. Hodson, Bradford; J. Barrow, jun., Kendal; T. Blackburn, jun., Northalton. *Brown-breasted and other Reds*, except *Black-breasted*.—1, C. W. Brierley. 2, A. Haslam, Headley, Wigan. 3, E. Aykroyd, Eccleshill. *hc*, J. Laming; F. Sales; W. Johnson, Idle, Leeds; J. Barrow, jun.; J. W. Thompson, Southwray, Halifax. *Chickens*.—1, J. Firth, Chatsworth, Derbyshire. 2, T. Bottomley, Shelf, Halifax. 3, C. W. Brierley, Middleton. *hc*, J. Wilkinson, Farby, Skipton. *Duck-wings*.—1 and Cup, H. Jowett. 2, J. Firth. 3, H. M. Julian. *hc*, F. Sales; W. W. Robertson, Halifax. *Chickens*.—1, H. C. & W. J. Mason, Drighlington. 2, J. Firth. 3, W. J. Cope, Barnsley. *hc*, H. M. Julian; M. Jowett; E. Winwood, Worcester. *c*, J. Wilson, Ilmington Moor, Halifax. *Any other Variety*.—1, E. Aykroyd. 2, J. Sables, Great Urthwaite. 3, F. Sales. *hc*, H. C. & W. J. Mason; Duke of Sutherland, Trenham Hall, Stoke-on-Trent; R. Butcher, *Chickens*.—1, E. Aykroyd. 2, C. W. Brierley. 3, R. & M. Walker, Woodwood, Gomersal. *hc*, E. Winwood. *Cocks*.—1, T. Mason, Green Ayre, Lancaster. 2, R. Butcher, Cresswell, Chesterfield. 3, F. Sales, Crowle, Doncaster. *hc*, H. M. Julian; W. Spencer, Haworth (2); J. Laming; J. Firth; C. W. Brierley. *c*, E. Bronagh, Leek.

DONKEYS.—1 and Cup, L. Patton, Hillmore, Tannock, Somerset. 2, C. W. Brierley. 3, H. Ebdon, Gortstock, Bingley. *Chickens*.—1, W. H. King, Sandfield, Rochdale. 2, Rev. G. Bunsler, Stillingfleet, York. 3, J. White, Wariaby, Northallerton.

SPANISH.—1, Hon. Miss D. Pennant, Penrhyn Castle, Bangor. 2, W. Pickard, Thorne, Leeds. 3, H. Beldon. *c*, J. Thresh, Bradford; W. Schofield, Gildersome. *Chickens*.—1 and Cup, C. W. Brierley. 2, J. Thresh. 3, J. Booth, Sliden, Leeds. *hc*, H. Beldon; H. Wilkinson; J. Walker, Wolverhampton. *c*, S. Powell, Bradford; Hon. Miss D. Pennant.
COCHINS.—1, W. C. Gyles, Reigate. 2, and Cup, W. A. Taylor, Manchester. 3, T. Stretch, Ormskirk. *hc*, J. Cattell, Birmingham; R. White, Shirebrook, Sheffield. *Chickens*.—1, T. Stretch. 2, C. Sidgwick, Kiddleston Hall, Keighley. 3 and *hc*, W. A. Taylor. *Any other Variety*.—1, T. Stretch. 2, W. A. Taylor. 3, C. Sidgwick. *Chickens*.—1, C. Sidgwick. 2, E. Leech, Rochdale. 3, W. A. Taylor. *hc*, Rev. R. L. Storey, Derby; T. Stretch; R. White.

BRAHMA FOOTRAS.—*Any Variety*.—1, Hon. Miss D. Pennant. 2, W. Whiteley, Sh. field. 3, J. Thornton, Edge Hill, Sheffield. *Chickens*.—1 and Cup, W. A. Taylor. 2, J. Sichel, Timperley. 3, Dr. Holmes, Whitecoats, Chesterfield. *c*, W. Whiteley; J. Thornton.

HAMBURGERS.—*Gold-pencilled*.—1, H. Beldon. 2, H. Pickles, jun., Earby, Skipton. 3, J. Preston, Alerton, Bradford. *Chickens*.—1, H. Pickles, jun. 2, H. Beldon. 3, Duke of Sutherland. *hc*, J. Preston; J. Webster, Whitby. *c*, S. Smith, Northowram, Halifax. *Silver-pencilled*.—1 and 3, H. Beldon. 2, Duke of Sutherland. *Chickens*.—1, H. Beldon. 2, H. Smith, Keighley. 3, Duke of Sutherland. *Gold-eyebled*.—1, T. Walker, jun., Denton, Manchester. 2, H. Pickles, jun. 3, J. Buckley, Tannock, Ashton-under-Lyne. *hc*, H. Beldon; J. Walker, jun.; J. Ogden, Holtwood, Manchester; T. Boulton, Hanford; S. Soken-Treat, *Chickens*.—1 and Cup, H. Beldon. 2, J. Ogden. 3, J. Buckley. *hc*, T. Walker, jun.; T. Boulton. 1 and 3, H. Beldon. 2, D. Lord, Stacks-Leads. *hc*, G. & J. Duckworth, Canal Mill, Church; G. C. Hol, Lawton, Cheshire; S. Smith, Northowram, Halifax. *Chickens*.—1, H. Beldon. 2, T. Fawcett, Baildon, Leeds. 3, D. Lord. *hc*, G. & J. Duckworth. *Black*.—1, D. Walker, jun. 2, H. Beldon. 3, H. W. Ilmworth. *Chickens*.—1, C. Sidgwick. 2, W. A. Taylor. *hc*, J. Halliday, Keighley; J. Greenwood, Keighley; J. Walker, jun. (2); D. Clayton, Alerton, Bradford; W. Meddison, Glossop; Garside & Knott, Slaithwaite; T. Fawcett.

PLANDS (Any variety).—1, T. Dean, Keighley. 2, J. S. Senior, Dewsbury. 3, H. Pickles, jun. *hc*, H. Beldon. *c*, H. Beldon; P. Unsworth, Newton-le-Willows. *Chickens*.—1 and *hc*, T. Dean. 2, H. Beldon. 3, H. Pickles, jun.
FARMYARD CROSS or ANY OTHER VARIETY.—1, H. Beldon. 2, J. Sichel. 3, Mrs. J. Cross.

SELLING CLASS.—1, Baxter & Dawson, Idle. 2, W. A. Taylor. 3, D. Cartwright, Hill, Holmbyth. *hc*, H. Beldon; G. Sidgwick; J. J. Booth; C. W. Brierley; W. Whiteley; J. Roberts. *c*, J. Barker, Alerton, Bradford; T. Sharpe, Ackworth, Pontefract; E. Shaw, Plas Wilnot, Oswestry; W. J. Cope, Barisley.

BANTAMS.—*Black*.—1, W. H. Robinson, Keighley. 2, S. S. Mossop, Long Sutton. 3, Hudson & Barnip, Epsworth. *hc*, H. Beldon. *c*, J. Walker, Halifax; S. & R. Ashton, Mottram, Cheshire. *White*.—1, E. Winwood, Worcester. 2, Rev. F. Scarie, Newmarket. 3, H. Beldon. *Game*.—1 and Cup, W. Rogers, Sunderland. 2, J. Hudson, Great Horton, Bradford. 3, W. Bantley, Scholes, Cleckheaton. *hc*, J. Bamires; W. H. Newsome, Holbeck (2); J. C. Taylor, Oaklands, Leeds; S. Smith, Northowram, Halifax. *c*, S. S. Mossop. *Any other Variety*.—1, H. Beldon. 2, T. C. Harrison, Hull. 3, W. J. Cope, Barisley.

TURKEYS.—1, E. Leech. 2, F. E. Rawson, Thorne, Halifax. 3, Rev. G. Hunter, Stillingfleet, York. *hc*, Capt. Gunter, Wetherby.

GEES.—*White*.—1, E. Leech. 2, Rev. G. Hunter. 3, J. F. Absom, Kippax Lock, Greengate, Mottled.—1, E. Leech. 2, S. H. Scott, Rochdale. 3, Rev. W. Hunter. *hc*, H. Wise, Whitby; H. Horton, Bradford. 2, W. Crossley, Halifax.
DUCKS.—*Aylesbury*.—1, F. Leech. 2, W. Stonehouse, Whitby. 3, T. Wilson, Crosshills, Leeds. *Toucan*.—1, J. Sooton. 2, J. White. 3, E. Leech. *hc*, J. Newton; S. H. Stott. *c*, J. J. Waller, Kendal. *Any other Variety*.—1, S. Burn. Whitby. 2, T. C. Harrison. 3, C. N. Deaer, Chelsea. *hc*, S. & K. Ashton, C. Rev. G. Hunter.

CAMBERS.—1 and 2, E. Horner, Harewood. *hc*, E. Walker, Leicester. *hc*, H. Yardley, Birmingham.

POULDS.—1 and 2, E. Horner. *hc*, H. Adams, Beverley. *c*, J. Hawley, Digby.

TIMBLES.—*Short-faced*.—1, E. Horner. 2, C. Aton, York. *Any other Variety*.—1, J. Hawley. 2, G. H. Hirst, Marygate, York.

OWLS.—1, H. Adams. 2, Withheld.

FANTALS.—1, H. Adams. 2, J. F. Loversidge, Newark-on-Trent. *hc*, E. Horner.

FAGONS.—1, J. Firth, Dewsbury. 2, J. W. Cannon, Bradford. *hc*, H. Yardley. *Any other Variety*.—1, R. Patterson, Melrose. 2, W. B. Van Haansbergen, Newcastle-on-Tyne. *hc*, Clayton & Bairdow, Gillingham, Bradford; E. Horner. *c*, E. Horner.

JACOBS.—1, E. Horner. 2, W. B. Van Haansbergen. *hc*, J. Hawley; E. Horner. *c*, R. G. Sanders, Leven, Beverley.

TRIEMPTERS.—1 and *hc*, J. Hawley. 2, E. Horner.

NEWS.—1, W. B. Van Haansbergen. 2, H. Yardley.

DEACONS.—1, P. Giddan, South Harehead. 2, A. W. Weir, Lowestoft. *hc*, T. Kaye, Honby, Hundersfield; J. Hawley; H. Adams; F. Graham.

ANTWERPS.—1, H. R. Wright, Heckley, Birmingham. 2, H. Yardley. *hc*, W. A. Taylor. (The whole class commended.)

MAGPIES.—1 and 2, E. Horner. *hc*, J. Caudale, Copt Hewick, Ripon; H. Yardley.

ANY OTHER VARIETY.—1 and *hc*, W. C. Dawson, Olney. 2, E. Horner.

SELLING CLASS.—1 and *hc*, W. C. Dawson. 2, Clayton & Bairdow, Gillingham, Bradford. *c*, E. Horner.

RABBITS.

YELLOW AND WHITE AND TORTOIS-SHELL.—1 and Medal, A. H. Easten. 2, C. King, St. John's Wood, London. *hc*, Mrs. Arkwright, Sutton Scarsdale, Chesterfield; J. Quick, St. John's Wood, London; A. H. Easten. 3, D. Pickles, jun., Leeds; G. H. Hirst.

BLACK AND WHITE.—1, A. H. Easten. 2, G. H. Hirst. *hc*, J. Jones, Leeds; C. King.

SELF-COLORED.—1 and 2, G. H. Hirst. *hc*, J. Armstrong, Leeds.

GREY AND WHITE.—1, H. J. Tomkinson, Barton-on-Umber. 2, A. H. Easten.

SELLING CLASS.—1, C. Gravid, jun., Thorne, Doncaster. 2 and *c*, G. H. Hirst. *hc*, J. Quick.

JUDGES.—*Poultry*: Mr. Edward Hewitt, Sparkbrook, Birmingham; Mr. James Dixon, North Park, Bradford. *Pigeons and Rabbits*: Mr. T. C. Esquilant, Effra Road, Brixton, London.

EAST KENT POULTRY SHOW.

THIS was held at Ashford, December, 12th and 13th. There were upwards of 400 entries of Poultry and Pigeons, among which the following awards were made:—

DORRINGS.—*Coloured*.—*Hens*.—1, G. W. Greenhill, Ashford. 2, R. Cheesman, Westwell. *c*, J. Norwood, Mersham. *Chick*.—1, B. Smith, Ashchurch; Rev. T. E. E. Greenhill. 2, J. Norwood. *Mercham*. *Cock*.—1, J. Smith, Shilling Park, Patwryth. 2, Rev. E. Bartrum, Great Larkhamstead. *hc*, Miss Hales. *Pullets*.—1, Rev. T. E. Cato. 2, G. W. Greenhill. 3, R. B. Curteis, Ashenden. *hc*, G. C. Merton, Dover; R. B. Curteis (2); Mrs. E. C. Lee, Penhurst. *Cockerel*.—1, F. Merton, Smethth. 2, R. B. Curteis. *hc*, E. Hare; R. Cheesman; R. B. Curteis. *c*, G. Hine, Westcott, Dorking. *Silver-Grey*.—*Hens*.—1, G. W. Greenhill. 2, O. E. Cresswell, Hanworth Rectory. *c*, J. Norwood. *Cock*.—1, E. Greenhill, Little Chart, Ashford. 2, W. H. James, Ashchurch. *Pullets*.—1 and Cup, G. W. Greenhill. 2, J. Scott. 3, J. B. Plumtree. *hc*, F. Cheesman. *c*, C. A. Plumtree, Wingham. *Cockerel*.—1, B. Smith. 2, J. B. Plumtree. 2, J. Scott. *Elmsted*. *c*, J. B. Plumtree; F. Cheesman (2). *White*.—1, G. Hine. 2, J. Norwood. *hc*, Lady Dering, Surrenden, Ashford.

SPANISH.—1, Nichols & Howard, Canterbury. 2, C. S. Hammond, Ashford, *Chickens*.—1, Nichols & Howard. 2, W. Moss, Birchington, Margate. *hc*, J. H. A. Jenner, Battle. *c*, C. S. Hammond. *Cockerel*.—1, Nichols & Howard.

COCHINS.—1, Cranston & Duff. 2, Miss Hales. 2, W. White, Canterbury. *Any other Variety*.—1 and Extra, Miss Hales. 2, T. G. Ledge, Folkestone.

BRADIA FOOTRA.—*Dark*.—1 and Extra, W. Jacob, Shepherdswell, Dover. 2, H. H. Stickings, Ashford. *Light*.—1, G. Mills, Dover. 2, Miss Hales.

GAME.—*Black-breasted or other Reds*.—1, J. Jeken, Eatham. 2, G. Braham, Folkestone (Brown Reds). 3, J. H. Bayley, Ashford (Black Reds). *Chickens*.—

1, F. Rice (Black Reds). 2, M. Tomkin, Wittersham, Eye (Black Reds). 3, T. G. Ledger (Black-breasted Red). *he*, J. Jenkin (Black-breasted Red). *Any other Variety*. 1, E. Rice (Duckwing). 2, S. Muthew, Stowmarket (Duckwing). 3, Capt. Lamb, Canterbury (Blue Felt Penn). *Chickens*. 1 and Cup, and 2, J. Jeken (Duckwings). *he*, W. Foster, Deal (Duckwing); Mrs. E. C. Lee (Duckwing). *Cock*.—1, J. Jeken. 2, E. Rice (Duckwing). *he*, H. Lowe, Chatham. 3, C. Rogers, Hastings; G. Braham.

HAMBURGERS.—*Gold-spangled*.—1, W. W. Tickner, Ipswich. 2, Rev. F. T. Scott. 3, W. Taylor, Maidstone. *J. Dutton*. *Silver-spangled*.—1, M. Dorman, Ashford. 2, J. H. Hely, Lowestoft. *he*, W. Taylor. 3, Mrs. C. Russell, Ashford *Game*.—1, Mrs. J. P. G. H. Ashford. 2, P. Griffin, Folkestone. *he*, W. W. Tickner; W. Robinson, Ashford. *Silver-penciled*.—1, Withheld. 2, G. Hine. *POLISH*.—1 and 2, T. Griffin. 3, E. J. Reeves, Haywards Heath; Miss Hales. **CARVE-CRENS**.—1, W. Dring, Faversham. 2, Rev. H. H. Dombain, Westwell. 3, T. G. Ledger.

HOUDAN.—1 and Extra, Hills & Co., Brighton. 2, H. S. Fraser, Headley, Liphook. 3, G. Mills.

BANTAMS.—*Gold and Silver-laced*.—1, Mrs. E. C. Lee. 2, Withheld. *Black, White, or any Variety*.—1, Miss E. J. N. Hawker, Wyellife, Tunbridge Wells (Silky). 2, F. G. Phillips, Hastings (Black).

GAME BANTAMS. 1, Nichols & Howard. 2, H. Simmonds, Reigate. 3, Rev. E. S. Tiddeman (Childeritch Vulture). *he*, H. Lowe. 3, J. B. Plumpton.

DUCKS.—*Aylesbury*.—1, W. Jacob. 2, W. Young, Kennington, Ashford *he*, G. W. Greenhill. *Rouen*.—1, C. S. Hardy, Chatham Castle. 2 and *he*, W. F. Harvey, Thurly, Chatham.

TURKEYS.—1, Mrs. H. H. Ashford. 2, W. S. Powell. *he*, D. Swaffer, inn, Kingsworth, Ashford. *Goslings*.—1, Mrs. S. Powell, East Lenham. 2, W. H. Mold, Bathersden. *he*, C. Rogers, Ashford.

TURKEYS.—1, C. S. Hardy. 2, J. Fould, Westwell. *he*, Miss Hales; E. H. K. Huggess, M.P., Ashford. 3, W. H. Mold. **POULTS**.—1, Rev. N. J. Ridgely, Houghton House, Newbury. 2, W. B. Sharp. *he*, C. J. Plumpton. 3, J. Fould; C. S. Hardy.

ANY OTHER VARIETY.—1, J. Brissenden, Canterbury (Black Gelder). 2, Countess of Aylesbury, Farningham Hall, Kent (Cuckoo Dorking). *he*, Rev. N. J. Ridgely (Malay); Miss Hales (Andalusian). 3, E. J. Reeves (Sultan).

PIFFONS.—*Carriers*.—1, J. Bowes, Hemo Bay. 2, W. Foster. 3, G. Wise, Preston, Faversham (2); W. Foster. **POUTERS**.—1, J. F. Loveridge, Newark. 2 and 3, J. Bowes. **TUMBLERS**.—1, J. Bowes. 2, W. Irlesden, Ashford. **FANTAILS**.—1, A. A. Vander Meersch, Perry Hill, Sydnam. 2, J. F. Loveridge. 3, G. W. Greenhill. *Any other Variety*.—1, A. A. Vander Meersch. 2, J. Bowes (Black Barbs). 3, Miss Hales (Runts). 3, Miss Hales (Trumpeters); A. W. Wren, Lowestoft (Yellow Francos).

JUDGE.—Mr. Tegetmeier.

WEST HERTS AGRICULTURAL SOCIETY'S POULTRY SHOW AT WATFORD.

AGRICULTURE would seem to flourish in the good county of Hertfordshire, and the uses of competition having made themselves patent, a locale was wanted where produce could be exhibited. Hence the building in which this Show was held, a truly excellent one for the purpose. It is a large square building, with moveable iron fittings for cattle of every description. All the modern appliances have been adopted. Although cattle is not our vocation, we cannot help noticing the ingenious and comfortable way of tying them, and the excellent contrivance for putting up the eards. The cattle, sheep, pigs, and roots occupied the floor, while the poultry were comfortably ranged in the spacious gallery that surrounds the building and would afford good accommodation for a greatly increased number. We were very glad to hear, that by being let for many useful purposes, the interest of the sum expended is already provided for at five per cent. The hearts of the good folks of Hertfordshire seem to be inclined towards boeotic pursuits, and the things that belong to them. There were eight cups or pieces of plate of five guineas each, offered for different breeds, and a silversmith attended with a tempting display of articles from which the fortunate could choose.

This is entirely a local Show, and we are glad to be able to speak most favourably of the entries. The *Dorkings* were excellent, so far as the Greys were concerned, but the *White* were represented only by one very worthless pen. *Partridge Cocks* were here shown in that which they require, a staring light, and we thought them better than at Birmingham. Lord Chesham carried off the cup. The *Buff Cochins* are decidedly not favourites in agricultural districts, or if they are, not in Buff classes. While there were thirteen of the Partridge, there were only three of any other variety, and those of such poor character that the first prize was withheld. The *Brahmas* were very good, both Light and Dark. Few of the pens of *Game* were dubbed, but many were very good. If it be adopted, as at large and general shows, that all birds be dubbed, notice should be given to exhibitors that birds with combs and gills will be disqualified. The *Hamburgers* were far above the average at local shows. *Game Bantams* were well represented, and successful over their competitors. It was curious that in their native county *Schripts* were not forthcoming.

All the birds of which we have treated were chickens of 1870, but the next was a class *sui generis* for all breeds and all ages, but no pen to exceed £2 in price. It brought a good show of different breeds. There was an excellent show of *Rouen*, but a poor show of *Aylesbury Ducks*. The latter do not show well anywhere in comparison with their antagonists. The *Geese* were very good, but as usual the *Toulouse* were the heaviest. There were some good *Saddlebacks*. The *Turkeys* were excellent. It will be seen that the result of this Show is to prove that the poultry question is looking up—that in a limited area the farm poultry—i.e., *Dorkings*, *Geese*, *Turkeys*, and *Ducks*, are all largely represented as farm stock shown by those engaged in agriculture. We take this to be the aim of such societies, and we congratulate them on their deserved success.

DORKINGS.—*Coloured*.—1 and Cup, Rev. E. Bartrum, Great Berkhamstead. 2, J. H. Barnes, Rickmansworth. *he*, Rev. E. Bartrum; C. Snewing, Holywell, Watford.

COCHINS.—*Partridge*.—1, 2 and Cup, Lord Chesham, Chesham. *he*, C. A. Barnes; T. Clutterbuck, Rickmansworth; R. Horsfall, Watford. 3, R. Horsfall. *Any other Variety*.—1, Withheld. 2, R. Horsfall.

BRAHMA POOTRA.—*Dark*.—1, Mrs. King, Watford. 2, R. Horsfall. *he*, T. Clutterbuck; R. Horsfall. *Light*.—1, Lord Chesham. 3, R. Horsfall. **GAME** (Any variety).—1 and Cup, T. Paramor, Eldreth. 2, W. F. M. Copeland, Watford.

HAMBURGERS (Any variety).—1, A. J. Copeland, Upper Nascott. 2, R. L. James, Watford. 3, E. Moon, Watford (2).

BANTAMS.—*Game*.—1, Lord Chesham. 2, C. Waghorn, St. Albans. *Any other Variety*.—1, Lord Chesham. 2, Withheld. **CARVE-CRENS AND HOUDANS**.—1, T. Clutterbuck. 2, A. T. Brett, M.D., Watford House.

ANY OTHER VARIETY.—1, A. J. Copeland (Dorkings). 2, E. Bartrum (Dorkings). *he*, C. A. Barnes (Brahms); Mrs. King (Game); E. Majoribanks, Bashey (Dorkings); R. Horsfall (Partridge Cocks).

DUCKS.—*Aylesbury*.—1, Lord Chesham. 2, G. Waghorn. *Rouen*.—1, C. A. Barnes. 2, W. F. M. Copeland. *he*, C. A. Barnes; E. Moon. 3, E. Moon. *East Indian*.—Frize, C. A. Barnes.

ANY OTHER DISTINCT BREED.—1, T. Clutterbuck. **GEESE** (Any variety).—1 and 2, C. A. Barnes. *he*, J. H. Barnes. 3, G. Stone, Watford.

TURKEYS (Any variety).—1 and Cup, R. Blackwell, Chipperfield. 2, W. J. Loyd, Langleybury, Watford. *he*, C. A. Barnes; G. P. Dodge, Rickmansworth; W. J. Loyd. 3, C. Longland, Stensish, Hemel Hempstead; T. Paramor.

JUDGES.—The Rev. G. F. Hodson, Mr. Baily, and Mr. Botham.

BINGLEY PIGEON SHOW.

This was held on the 16th and 17th inst. The awards are as follow:—

POUTERS.—*Cock*.—1, G. Strassers, Leicester. 2, E. Horner, Harewood, Leeds *he*, W. Harvey, Sheffield. *he*, E. J. Dew, Weston-super-Mare; G. Strassers; E. Horner; E. P. Moon. *Hens*.—1, Cup, and 2, E. Horner. *he*, G. Strassers; W. Harvey; G. Strassers.

CARRIERS.—*Cock*.—1, E. White, Birmingham. 2, E. Horner. *he*, E. Smith, St. Albans, Birmingham; T. Colby; G. J. Taylor, Huddersfield (2). 3, T. Colby, Sheffield. *Hens*.—1, Cup, and 1, G. J. Taylor. 2, E. Horner. *he*, W. H. Stichey, Mosely, Birmingham; E. Horner; G. J. Taylor.

TUMBLERS.—*Almond*.—1, E. Horner. 2, W. Harvey. *he*, E. J. Dew. *he*, G. J. Taylor; J. Stanley, Blackburn; H. Yardley, Birmingham; J. T. Lishman, Gillingham. *Any other Variety of Short faces*.—1, F. Moore (Black Kite). 2 and *he*, G. J. Taylor (Yellow). 3, W. Kitchen, Burnley. *Common*.—1 and Cup, W. Harvey. 2, J. F. Lishman.

BARBS.—1 and 2, J. Firth, Dewsbury. *he*, J. Thresh, Shipley; H. Yardley; E. Horner.

OWLS.—*Foreign*.—1, J. Fielding, jun., Rochdale. 2, J. Stanley. *he*, W. C. Dawson, Otley; W. Harvey. *English*.—1, T. Newell. 2, T. Waddington. *he*, J. G. Golden, jun., Hale, Altrincham; J. W. Edge; J. Crossland, jun., Wakefield.

JACOBIANS.—1, E. Horner. 2, J. W. Edge, Birmingham. *he*, J. Newell, Ashton-under-Lyne. *he*, W. B. Van Haansbergen, Newcastle-on-Tyne.

TURBOTS.—1, W. B. Van Haansbergen. 2, J. Firth. *he*, W. H. C. Oates, Besthorpe; E. Horner (2); J. Hawley (2); J. Firth. 3, J. Hawley.

TURBOTS.—1, J. W. Edge. 2, G. South, East Acton. *he*, O. E. Creswell, Hanworth Rectory; J. Fielding, jun.; W. Lund, Shipley; W. B. Van Haansbergen. 3, E. J. Dew.

DAKONS.—1 and Cup, J. Holland, Manchester. 2, G. South. *he*, F. Graham, Birkhead.

FANTAILS.—1 and Cup, J. Sharp. 2, Rev. W. Sergeantson, Acton Burnell. *he*, W. Edge; H. Yardley; W. Harvey.

ANTWERPS.—1, E. Horner. 2, J. A. Collinson, Halifax. *he*, R. Sidwick, Kockley; J. Broadbent, Denton; H. R. Wright, Hockley, Birmingham (2); W. H. Mitchell; J. Deakin, Sheffield; J. Crossland, jun. 3, J. A. Collinson.

ANY OTHER VARIETY.—1, W. C. Dawson (2). 2, W. Harvey (2). *he*, E. Horner; T. Waddington (Spud); J. T. Lishman (Black Swallows); J. Hinks, jun., Birmingham (Red Swallows).

SPRINGING CLASS.—1, E. Bellon, Bradford (Red Barbs). 2, J. T. Lishman Blue Owl. *he*, J. E. White. 3, W. Kitchen (Dragon). Extra Prize to the exhibitor obtaining the most points, E. Horner.

JUDGES.—Mr. T. J. Charlton, Bradford, judged the classes for Pouter cocks, Pouter hens, Carrier cocks, Barbs, Foreign Owls, Jacobins, Fantails, English Owls, and Antwerps; and Mr. T. H. Ridpath, Manchester, judged the remaining classes.

SCOTTISH COLUMBARIAN SOCIETY'S SHOW.

This Show was held on the 15th and 16th inst., in the Music Hall, George Street, and was a great success. We must defer detailed remarks till next week.

YOUNG BIRDS.

POUTER COCKS.—*Black*.—1, 3, *he*, and 3, G. Ure, Rosebank, Dundee. 3, J. Wallace. *White*.—1, J. McGill, Elie. 2, W. Moon, 3, J. Fairley, Edinburgh. 3, W. Pathford, Edinburgh. *he*, G. H. W. Volekman, Edinburgh; J. Cars, Edinburgh. *Blue*.—1, W. Volekman, Bishopscate Street Within, London. 2 and Special, J. Millar, Glasgow. 3, J. Morrison, Morningside, Edinburgh. *he*, M. Stuart. *Glasgow*. 3, G. Ure (2). *Red*.—1, W. Volekman. 2, J. Millar. 3, R. Fulton, Don Road, London. *Yellow*.—1, E. Horner, Harewood, Leeds. 2, G. Ure. 3, A. Wright, Morningside, Edinburgh.

POUTER HENS.—*Black*.—1, G. Ure. 2, J. Millar. 3, J. Mitchell. 3, J. Hnie, Glasgow. *White*.—1, J. McGill, Elie. 2, W. Moon. 3, J. Fairley, Edinburgh. 3, W. Rutherford, 3, E. Horner. 1, M. Stuart. 2, G. Ure. 3, J. Millar. *he*, W. Volekman; F. Horner. 3, J. Mitchell, Glasgow; J. Blair, Edinburgh. *Red*.—1, A. Wright. 2, G. Ure. 3, G. Taylor, Edinburgh. *Yellow*.—1, J. Wallace, East Glasgow. 2 and 3, G. Ure. *he*, W. Volekman. 3, G. Ure; R. Fulton.

CARRIER COCKS.—*Black*.—1, E. Horner. 2 and 3, G. C. Holt, Lawton, Cheshire. *Dun*.—1, R. Fulton. 2 and 3, G. C. Holt.

CARRIER HENS.—*Black*.—1, G. C. Holt. 2, R. Fulton. 3, E. Horner. *Dun*.—1 and 2, G. C. Holt. 3, E. Horner.

ARM AND TUMBLERS (Short faced).—1, W. R. & H. O. Hinkinson, Newcastle Barbs. —1, R. Fulton. 2, W. Massey, Spalding. 3, G. C. Holt. 3, G. White Ladyburn, Paisley.

FANTAILS.—1, G. Ure. 2 and 3, J. Hnie. **TRUMPETERS**.—1 and 2, T. Rule, Durham. 3, J. Wallace (Black).

OLD BIRDS.

POUTER COCKS.—*Black*.—1, R. Fulton. 2, 3, and *he*, G. Ure. 3, J. Millar. *White*.—1, M. Sanderson, Edinburgh. 2, W. Rutherford. 3, J. Wallace. *he*, J. Porteous, Edinburgh; R. Blair, Edinburgh; J. Ruthven, Pollockshields, Glasgow. 3, W. Hendrie, Aberdeen; J. Hnie. *Blue*.—1 and 2, R. Fulton. 3, J. Spruell, Glasgow. *he*, M. Stuart; D. Stewart, Perth; R. Fulton; J. Hnie. 3, M. Sanderson. *Red*.—1, A. Wright. 2, R. Fulton. 3, J. Main, Kilmarnock. *he*, J. Bruce, Dunfermline; R. Fulton. 3, G. Ure; R. Fulton. *Yellow*.—1, W. Volekman. 2 and 3, R. Fulton. *he*, G. Ure. 3, M. White, Dunfermline. *Any other Colour*.—1 and 2, W. Volekman (Mealy). 3, J. McGill (Chequer). *he*, D. Stewart (Splash); W. Volekman. 3, D. Stewart (Mealy); J. Ruthven (Splash).

POUTER HENS.—*Black*.—1 and Special, R. Fulton. 2, J. Hnie. 3, J. Millar. *he*, M. Stuart; J. Wallace. *White*.—1, R. Fulton. 2, M. Stuart. 3, J. Rutherford. *he*, J. Wallace. 3, R. Blair; C. Thomson, Broughty Ferry. *Blue*.—1 and 2, R. Fulton. 3, J. Millar. *he*, G. Ure; R. Fulton. 3, T. Duncan, Dal-

keith; J. Lnis, Edinburgh. *Red*.—1, J. Millar. 2, R. Fulton. 3, M. Sanderson. *hc*, J. Morrison. *c*, J. Huic. *Yellow*.—1 and 2, R. Fulton. 3, A. Wright. *hc*, G. Ure. *c*, G. Ure; R. Fulton; W. Volckman. *Any other Colour*.—1 and 3, W. Volckman. 2, J. Ruthven. *hc*, W. Moon (Splashed); J. Carss. *c*, J. Bruce; D. Stewart (Checker).

CARRIER COCKS.—*Black*.—1 and 2, R. Fulton. 3, W. Massey. *Dun*.—1 and 2, R. Fulton. 3, W. Massey.
CARRIER HENS.—*Black*.—1, 2, and 3, R. Fulton. *Dun*.—1, 2, and 3, R. Fulton.
ALMONDS.—*Short-faced*.—1, W. R. & H. O. Blenkinsop. 2 and 3, R. Fulton. *Any other Colour*.—1, R. Fulton. 2, W. R. & H. O. Blenkinsop. 3, J. Wallace (Kites). *hc*, J. Bruce.

FARUS.—*Black*.—1 and 2, R. Fulton. 3, J. Wallace. *Any other Colour*.—1, J. Fielding, jun., Redclife (Yellow). 2 and 3, R. Fulton (Red and White).

FANTAILS.—1, T. Wilson, Stewarton, Ayr. 2, A. Lookhart, Kirkcaldy. 3 and *hc*, G. Ure. *c*, J. H. Bruce.

TROUSERS.—1 and 2, R. Fulton. 3, J. Wallace (Red).
JACOBINS.—1, T. Rule. 2, H. L. Tivy, Cork (Mottled). 3, W. R. & H. O. Blenkinsop.

OWLS.—1, J. Fielding, jun. 2, R. Fulton. 3, W. Goldard, Earlston (White).
TURKETS.—1 and 2, Capt. Bolton, Trinity, Edinburgh. 3, T. Rule. *c*, R. Paterson, M. Rose (Blue); J. R. Rennards, Helensburgh (Red); W. R. Park, Abbots Meadow, Melrose (Blue); H. L. Tivy.

NEWS.—1, W. R. Park, Hill. 2, C. Thomson. 3, M. White.
MAGPIES.—1, J. Grant. 2, E. Horner. 3, G. B. Phillips, Ayr.

FLYING TUMBLERS (Any colour).—1, J. Sharp (Mottled). 2, J. M. Braid, Cambridge (Baldheads). 3, T. Rule.

ANY OTHER VARIETY.—1, Capt. Bolton (White Runts). 2, J. Wallace (Alyssians). 3, E. Horner. *hc*, W. R. Park (Lutz); J. Wallace (Damascene). *c*, W. Goldard (Austrian Pouters); J. Wallace (Lace Fantails).

JUDGES.—Mr. D. Wolstenholme, and Mr. E. L. Corker.

TREDEGAR POULTRY SHOW.

This year the entries at Newport were considerably more numerous, and the quality much better, than at any previous show, although five other shows were held on the same date, and this we attribute to the general good management and courtesy of the Secretary, Mr. Palling, whose efforts were well seconded by Mr. Nicholas and other members of the Committee.

On our left on entering we found the *Game* classes, the Black and Brown Reds being in the first position on the schedule; and in this class Brown Reds were first with the cup for the best pen of *Game*, but were closely pressed by a pen of adult Piles in the following class. There were also some good Duckwings, but the hens were mostly a little coarse in colour and marking. Of *Spanish* there were some capital birds, but the cocks were superior to the hens, some of the latter being a little coarse in comb; the cock in the cup pen was a gem, and in fine condition. The *Dorkings* were of large frame, the feet, as a rule, very good, and the colour of the Dark Greys very sound. There was one pen of Silver-Greys which would, doubtless, have had first honours had it not been for the excessive marking on the hackle of the cock; as it was, the first and cup for *Dorkings*, also the piece of plate, value £28, for the best pen in the Show, were won by dark Rose-combed birds. This was contrived by a few gentlemen of the locality, at the head of whom was the Mayor of Newport. Buff *Cochins* were good, with the exception of a little mealiness on the tails and wings of some of the old birds, though the colour of the winners was faultless. Partridge were a good lot, the hen in the first-prize pen being one of the best faced birds we ever saw, and both birds perfect in style and feather. The cup for this section was won by this pen. There were some nice Whites, but the best pen arrived too late for competition. Light *Brahmas* were much superior to those at any previous show, yet many of them were wanting in marking on the hackles and tails. The Dark *Brahmas* were numerous, and the commendations widely diffused. As a rule, the cocks of this colour were better than the hens; the hens that were best in shape, size, and facing being mostly too brown on the ground colour—a fault that cannot too quickly disappear.

Next were the *Hamburgh* classes, and these were well represented, the cup going to Silver-spangled. The Golden-pencilled were an even lot, and the contest keen. The Silver-pencilled were also good, but not equal to the Golden variety; and in the Gold-spangled we thought the hens superior to the cocks, some of the latter being too high in comb, though the winning birds were good in that respect. Of *Pouter*s there were but three pens, all Silvers, and good in all points. The *French* fowls were represented by two classes, the *Hondans* being large and well marked, although some of the cocks had more of the *Crève-Cœur* comb than that of the *Hondan*. In the next class *Crève-Cœur*s were first, and took the cup for the best pen of French fowls, and *La Fleche* second. There were four classes for *Bantams*, the first of which was for *Game*. There were several smart pens, the winners being Black Reds, with Duckwings highly commended. Of Blacks, some of the birds were not good in comb; but throughout, the earlobes were perfect and the plumage very good. The only fault we found with the first-prize pen was that they were a little too large, though in all other points quite to our liking. In Whites Messrs. Ashton won with a very fine pen, the plumage being perfect; and in the "Variety class" the winners were both Silver *Sébrights*, the marking of which was very good. In the "Any other variety class" the first prize went to very neat Black *Hamburghs*, the second to Malays, the third to White *Dorkings*, and the fourth to *Sultans*.

Ducks were very numerous, both *Aylesbury* and *Ronen* being large and good in bill and plumage, though among the *Ronens* were several birds with leaden-coloured beaks, which are altogether inadmissible in a prize pen. That most attractive and ornamental section of aquatic birds, "the *Variety class*," was well filled, and great difficulty was experienced in making the awards, there being so many good pens that more prizes could have been worthily awarded.

Geese and *Turkeys* were quite up to the mark. In the former class Mr. Fowler won with a very large pen, though not quite to our liking in colour. The winning *Turkeys* were Cambridge.

There were two selling classes, one for fowls and the other for Ducks, and both were well supported with cheap lots, which offered great advantages to intending purchasers.

There were some good birds in all the *Pigeon* classes, and these might be extended with advantage, only nine classes being devoted to them. Mr. Yardley won the plate for the best pen of *Pigeons*, although Mr. Hawley was in dangerous proximity with a grand pair of Black *Trumpeters*. In the "Variety class" Nuns were first, Black Swallows second, Mated *Pigeons* third, and Barbs fourth. We published the prize list last week.

GUILDFORD POULTRY SHOW.

This is one of the pleasant local gatherings that warn us of the approach of Christmas. It took place on the 12th and 13th inst., in connection with a show of fat stock. The whole of the Exhibition was formerly held under the same roof, but it has grown and expanded till it requires a separate building for the poultry.

It will readily be supposed that in Surrey the *Dorkings* would muster in strength. Being confined to a small area, the competition would appear small in numbers as compared with those that are open to all England, but we have no hesitation in saying the birds successfully shown at Guildford would have been prize birds at Birmingham. We have seldom seen better, and we could not help thinking it was a pity the Committee did not remove all restrictions, and throw down the gauntlet to England. The White *Dorkings* were very good. The third class is peculiar to Guildford. It is made-up of birds called in this part of Surrey Blue *Dorkings*, but known elsewhere as *Cuckoos*. There was a capital entry of good birds. A most excellent pen was shown by one of the Committee, who, with a delicacy that is worthy of imitation, declined to compete because he held office. The *Spanish* were good, but not so numerous as we have seen on other occasions. The *Cochins* were a failure in every respect, and the first prize was withheld. So long as the Show is a local one, we almost doubt the wisdom of continuing the class. There is always a good show of *Brahmas*, especially of Light birds exhibited by Mr. Pares, who may, we believe, be called the originator of the Light classes. Two pens of good Dark birds were disqualified in this class, the legs being distinctly marked with string and tape.

The entries of *Game* were small, and many pens were shown in which the cocks were not dubbed. There are always good *Hamburghs*, and this year they formed no exception. The *Bantams* were well represented. The Black Red *Game* birds of these classes, now carefully bred, are fast attaining the perfection of their larger namesakes. The entries of *Ducks* were good, but here, as elsewhere, the *Ronens* in every way surpassed the *Aylesbury*. They were excellent in weight and feather. The "Variety class" brought *Summer* and *Calls* as usual. The *Geese* and *Ducks* are always good here. They would have been noticed anywhere. The Toulouse as usual carried off the former prize. The curious-looking *Sebastopol* may be among the admired, but they cannot compete with the others on the question of weight, and, consequently, of utility.

We believe this part of England is favourable to *Turkeys*, they always appear in numerous entries, and of excellent quality. There is one point we frequently notice, which is, that there seems almost a certainty of like begetting like among these birds; it almost always happens that the same exhibitor takes the prizes for young and old birds. Mr. Messenger did so in this instance. In the "Various class" there were some good *Hondans* and *Crève-Cœur*s. We were never admirers of crosses, and those we saw between *Dorking* and *Brahma*, and *Dorking* and *Cochin*, did not alter our opinion.

Mr. Baily was the Judge.

BERWICK CANARY SHOW—PRIZE LIST EXTRAORDINARY.

WHEN I received the schedule of Berwick-on-Tweed Show, and noticed on what an absurd principle the silver cup was to be awarded—viz., first prize to count 6; second, 5; third, 4; very highly commended, 3; highly commended, 2; and commended, 1, I clearly foresaw that something absurd would result. It was easy to suppose any number of cases based on these premises, which could result in nothing but an absurdity, even to the extreme case of an exhibitor winning the silver cup without taking a single prize; but I scarcely imagined that the result would, in actual fact, be such an extraordinary exemplification of the fallacious principles on which the award of the cup was made.

I will take the prize scores of the three most successful exhibitors—Messrs. Moore & Wynn, Mr. Barnesby, and Messrs. Wallace & Beloe. An analysis shows that Moore & Wynn won thirteen prizes, scoring sixty-five points; Barnesby won six prizes, scoring thirty-four points; Wallace & Beloe won six prizes, scoring twenty-nine points. Moore and Wynn's list consisted of five firsts, three seconds, and five thirds. Barnesby's consisted of four firsts and two seconds. Wallace and Beloe's consisted of one first, three seconds, and two thirds. A single glance will show the relative value of these scores. Moore & Wynn take more prizes than the other two put together, and the sum of their

prize points is in excess of the sum of the other two; yet by the aid of the very highly commended, the highly commended, and the commended scores, Messrs. Wallace & Beloe are enabled to add the large number of fifty-five points to their small twenty-nine, and carry off the cup with an aggregate of eighty-four points.

Of course, this is all according to the conditions under which the cup was to be awarded, as set forth in the schedule, and is, therefore, all strictly fair. It is only the absurdity of the conditions with which I have to do. Anyone at all acquainted with Canary shows must be aware that as an almost invariable rule (for exceptional cases are so very rare that the rule may almost be accepted as unvarying), no disposition of points can represent the relative values of the first, second, and third-prize birds, and the next half dozen below them. No handicapping can bring them together. In the majority of instances the difference between the first and second is very inadequately represented by the ratio 3:2, and the gap between the first and third is wider still, while the mathematical genius has not yet been born who can invent a scale of notation to represent in any known terms the comparison between the prize birds and the very highly commended, highly commended, and commended, which follow in a descending scale, precipitously steep, terminating in a rubbish heap.

The principle upon which commendations of any degree are awarded is different from that which regulates the awarding of the prizes. It is seldom we see two equal firsts or seconds—never, in fact, unless the judges are empowered to give duplicates, and then the wisdom of the step is questionable, and the position barely tenable; but commendations are scattered with a much more lavish hand, and any sensible man knows the value of them. Sometimes judges are instructed to be liberal in their commendations, and it is not unusual to see three or four very high commendations, and as many of the lower grades in one class. But no one will venture to say that the three or four very highly commended judged as being of equal merit are so in reality, and that it would be impossible to separate the three without an injustice to one or the other, or that the highly commended and the commended are equally inseparable. They are judged on more general terms, and may be considered as being divided into three groups, not too closely sifted and classified according to their general merit. But the most meritorious of them (and an exhibitor by entering a number of them may score many equal very high commendations, or commendations in one class), is far removed from the third-prize bird, and most certainly deserves to contribute nothing towards prize-winning.

Birds capable of holding their own against all comers are few and far between, very difficult to breed, and very valuable when obtained. Fourth, fifth, and sixth-rate birds are plentiful as blackberries, easy to breed, and not worth the seed they eat in comparison with the others. The one class, which represents an ideal standard of perfection, cannot be produced in large numbers, but the other can and is; and any man by procuring a sufficient number of them can render it practically an impossibility for an exhibitor of high-class birds to win a prize he values more than money, and a schedule has been found offering this facility. Even if there were only one very high commendation, one high commendation, and one commendation, it would be bad enough; but it is, apart from the absurdity of the thing, a manifest injustice to give one first, one second, one third, and an unlimited number of equal very high commendations, high commendations, and commendations. A silver cup does two things—it represents so many ounces troy at so much per ounce, and it also tells a story. Sardonically first, second, and third in the race were inscribed upon it, it would like to turn its face to the wall.—W. A. BLAIRSON.

FOUL BROOD.

THE above subject being again brought up, reminds me that my contributions to "our Journal" have fallen very much behind, and that I owe your esteemed correspondent, Mr. J. Lowe, an apology for not advertising sooner to his last paper on "Foul Brood," in Nos. 409 and 410, not that I have anything particularly new to communicate, but on the principle that "silence gives consent." I might be held as homologating the peculiar views put forth.

While perusing with much interest, and very great pleasure, Mr. Lowe's clever five years' *résumé* of this controversy, still I must confess it left a rather perplexing impression on the mind, to find your correspondent, who so long and persistently decided the existence of such a disease, seemingly clinging to his old hypothesis, that the appellation foul brood was synonymous with chilled brood, induced by experimenting, and curable by excision, even while quoting the ravages of the fell destroyer to the extent of one hundred colonies in one year in the American apiary of Mr. Quinby, and to no less than five hundred in 1848, in that of the German one of the celebrated Dzierzon, while endeavouring in the most ingenious manner to bend the most opposite opinions as to its origin in support of his pet theory, on no better foundation than that "extremes meet."

I quite agree with your correspondent, that "it is strange,"

on the assumption that foul brood is no disease, but simply an effect of over-experimenting, that while Mr. Quinby should have lost so very heavily, his transatlantic brother, the Rev. L. L. Langstroth, states that the malady never made its appearance in his apiaries, more particularly when it is borne in mind that the latter gentleman first introduced the frame hive, and may be held as the most experimental apiarian on that continent; and stranger still that "A DEVONSHIRE BEE-KEEPER," for whose frank and graphic description of its ravages we are all so much indebted, assures me that while "more experimental than ever," it has never re-appeared in consequence.

It was with much pleasure I accepted Mr. Lowe's proffered invitation to accompany him through his "Loz's mountain pass." We there discover the remains of what was once a living organism. While awaiting in wrapt attention his opening the inquest, my metaphorical companion, sniffing the tainted atmosphere, moves off with a rhetorical flourish, "What matters it, whether that once living form was deprived of life by frost or fire, by cold or heat, whether by an electric flash of heaven's hot artillery, &c.?" Not possibly very much to the mere theorist, but everything to the unfortunate apiarian who has had his apiary repeatedly swept by foul brood, and something, too, one would suppose in a paper treating expressly on the origin of foul brood.

Its origin in its most virulent form in my apiary, now seven years since, was clearly traceable to infection through the interchange of combs with a diseased colony received from "A DEVONSHIRE BEE-KEEPER," before he discovered the cause of his "dwindling apiary," and he in like manner introduced the disease by using infected combs from a common straw hive, which latter fact Mr. Lowe has all along very unfairly ignored.

Having suffered so severely from the devastating effects of this most mysterious malady, I must confess to have acquired such a salutary dread of the smallest trace of its insidious advance, that my efforts have all along been more directed to "stamp out," than speculate or experiment with a view to trace its origin. I can, therefore, appreciate and feel all the more grateful to such correspondents as your valued contributors, "R. S.," and "A LANARKSHIRE BEE-KEEPER," for their practical efforts in this direction.

I am still of the opinion adduced in this Journal in the beginning of 1867, that "over-heating, rather than any amount of exposure and chill, induces this most mysterious malady," and I cannot comprehend how Mr. Lowe "hails this theory as one virtually quite in accordance with my own." If we take the case of chilled brood in a hive, it has been abundantly proved that such is removed by the bees, then Mr. Lowe's argumentative structure topples over; and if the pupae die solely from contamination with those in the adjoining cells, agreeably to Mr. Lowe's theory, how comes it that we find perfectly healthy bees frequently emerge from the very centre of corrupting masses? but how opposite is the result in an "over-heated" colony. I never said nor supposed that the death of the embryo, as a matter of course, followed parallel to that of chilled brood; on the contrary, heat is what young bees can stand a good deal of. Suppose we confine the inmates of a populous hive during warm weather in summer, the temperature at once rises, undue excitement follows, vapour is seen clouding the internal atmosphere, which, condensing on the windows, trickles down in streams. No doubt, if persisted in to extremity, the bees as well as brood would be suffocated, and the combs give way; but some time before such an extremity is reached if we open the entrance the inmates pour forth in streams to the fresh air over the landing board, and on to the ground, and seem for a time as if quite paralysed; labour is brought to a standstill, and although subsequently resumed, goes on but sluggishly, and if in the course of a few days we invert the hive unmistakable traces of foul brood will be too apparent, induced, doubtless, by the effects of the heat and the condensed moisture mixing with the unsealed honey, causing it to ferment, and acting in a deleterious manner on the larvæ when fed with it. The fermentation which is a consequence of mixing even unsealed with sealed honey drained in summer, is well known to all practical bee-keepers.

Confirmatory of this view, I may narrate an interesting case I met with where foul brood was subsequently induced in a healthy hive without the presence of brood at all in the first instance. Driving, on the twenty-fourth day after swarming, a bought-in cottager's common straw skep, I could not but admire, on examining the combs, how thoroughly every bee

had been hatched out. There was not a single cell-cover visible; and the operation having taken place while honey abounded, in addition to a large weight of sealed honey in the upper portion of the combs, a considerable area of the brood cells contained unsealed honey evidently freshly gathered in. From the healthful state of matters I resolved to cover it up and set it aside for a prospective stock hive, its own population having been added to an adjoining colony. At the end of the season, having been presented with the teeming population of two capital prime swarms, of the healthful condition of whose combs I had taken care to satisfy myself, they were duly conjoined, and I prepared to look out my beat-out skep, but it was nowhere to be found. Subsequently it was discovered stowed away as lumber in a very damp apartment, and, on making an examination, I was chagrined to find that overspreading the unsealed honey there was an abominable white mouldy fungus-like growth. If I had had but a few bees at command I would have hesitated before introducing them, but the heat and capabilities of such a body of bees I thought amply sufficient to counteract any bad effects following, and they were run up, and it was set down on a stance. Being so well found in population and store, it remained untouched till the following spring was well advanced, having calculated on a particularly early strong swarm, forgetting all about the state of the unsealed honey in the combs, till one remarkably genial day my attention was arrested by the paucity of the workers emerging from it, and it was forthwith inverted, when to my great mortification I found but a very small handful of bees, and the combs one mass of putrifying corruption from foul brood. Sentence of death was at once passed on the little band, and the contents of their hive consigned to the melting pot.

The evil effects of feeding with fermented foreign honey came to my knowledge a few seasons back. An extensive cottage bee-keeper, for economical reasons, purchased a large cask of this commodity, and from its extreme cheapness fed his stock very liberally. I afterwards saw in his garden, on more than one occasion, combs in a bad state from foul brood, of which he had previously no experience, as well as colonies sold from his apiary which failed to prosper from the same cause.

I am glad to be able to report, that although employing many more frame hives than formerly, my stock has for the last two seasons regained its pristine healthfulness; and when, last season, I was kindly favoured with a new cure (permanganate of potash) for my old enemy, I had not a case to try it with, and therefore sent it on to my friend "A STEWARTON APIARIAN," whose unsuccessful experiment has been already chronicled in these pages.—A RENFREWSHIRE BEE-KEEPER.

OUR LETTER BOX.

MORLEY SHOW.—Are other exhibitors like myself? I have received no prize money awarded to me at the last Morley Show. I have applied several times to the Secretary and received no answer.—H. W. HILLINGWORTH, *The Green, Idle, near Leeds*.—[Give the Secretary notice that you will see him in the County Court.—EDS.]

EARLOES OF DORCHES (H. S. D.).—The earloes of a Dorking is quite immaterial. We prefer it red, but it is sometimes tinged with white. You have been correctly informed when you were told it was a most important point in a Hambrogh. To that breed a red deaf ear is a disqualification; it must be perfectly white.

CRYSTAL PALACE POULTRY SHOW.—Owing to the late hour at which some of the classes were judged our reporters were obliged to leave before a few of the cups were awarded. We now give a list of those omitted in our report. Mr. H. J. Goifrey's Black Cochin took the cup in *Any other variety*. For the best young *Pouter cock*, Mr. Volekinn. *Carriers, any other colour*, Mr. Deane. Mr. Fulton won two cups—for *Blue Pied Pouter hens*, and the other for young *Barbs*. *Any other variety*, Mr. Wallace. For the best collection of *Short-faced Tumblers*, Mr. Ford. The third prize for *Black Bantams* was awarded to Mr. E. C. Inbridge; and Mr. J. Howes again exhibited a pair of his curious White Poking Bantams. Some exhibitors appear to remember the Impression, as the Show closed on Saturday, their birds were packed and sent away the same evening. The Commi tee were certain if they sent the birds away that night they would be kept at the railway station the whole of Sunday. The birds were therefore despatched on Monday, and every one was out of the Palace before 5 P.M. on Monday, and they should have reached their owners not later than Tuesday.

YORK POULTRY SHOW.—Mr. H. Andrews informs us that the first prize in the Felling class was won by his Dark Brahmas.

LA FLECHE HENS AT BIRMINGHAM.—We have received from our reporter at Birmingham a note, in which he says that he has not the slightest reason to doubt the correctness of the statement by the Hon. W. C. Fitzwilliam last week, as to the second-prize pair of La Fleche hens. He repeats, however, and thanks even Mr. Fitzwilliam will admit, that the appearance of the birds, on which his remark was founded, was precisely as stated, and was remarked upon by many, and if the strain had not been recently crossed by being run into the possession of the exhibitor, the pen must be regarded as neither of the uncommon nor, but very remarkable cases of inversion, or reversion to one of the races from which there is no doubt the La Fleche originally sprang. He

thanks Mr. Fitzwilliam for the gentlemanly tone of his note, which he is not willing to leave altogether unnoticed.

TAIL OF GOLD-PENCILLED HAMBROGH (*West of England Subscriber*).—A black tail is a disqualification in a Pencilled Hambrogh cock. The loss of a sickle is a great disadvantage, as it opens the door to suspicion.

COCHIN COCKEREL (*R. Crofton*).—Apply to some one who advertises, and do not buy until you have seen the bird.

MOTH IN SEAL SKIN (*Idem*).—Beat it, sprinkle camphor dust among the fur and hang in a warm dry place. When no insects are left keep the skin closely rolled in brown paper, several times enveloping it so that no moth can get to the skin, and keep it in a very dry place.

PIGEONS AT THE BIRMINGHAM SHOW.—Mr. Fulton writes to us that his Carrier Pigeons were neither trimmed nor oiled.

CARRIERS AT THE CRYSTAL PALACE (*An Exhibitor*).—We cannot insert your communication; it is, with little exception, at variance with the opinions of some of the best judges.

POUTER (*T. E. F.*).—The bird you describe is not an exhibition bird, it is too small, and merely is not usually a prize colour.

ENGLISH AND FOREIGN OWLS (*O. C.*).—We have often said that there is the same difference between English Owls and foreign or African Owls as between Long-faced and Short-toed Tumblers. The latter are delicate, small, fragile, and very tender. The fact of African Owls being bred in England does not make them English Owls. Barbs have for centuries been bred in England, yet they are called Barbs or Barbary Pigeons, because they originally came from that country. Although English Owls are more generally either powder blue or silver, yet there are white, black, or even yellow sometimes to be met with, and white with black tails.

HONEY INSIPID (*I. O. J.*).—If the so-called honey consists either wholly or in great part of sugar fed to the bees in the form of syrup, it would account for its insipidity. The character and taste of simple syrup is undoubtedly altered by being stored by bees in their combs, but it is not so full-flavoured as natural honey. The proportions of sugar and honey could only be ascertained by analysis.

REMOVING STOCKS OF BEES (*C.*).—We do not think you will find much difficulty in safely removing your bees domiciled in Woodbury hives to some distance by rail at this season. All that is necessary is to insure ventilation by covering the entrances and central apertures with perforated zinc, and to take care that the hives are carefully handled. A mild day should also, if possible, be selected for the removal.

METEOROLOGICAL OBSERVATIONS
In the Suburbs of London for the week ending December 20th.

COVENT GARDEN MARKET.—DECEMBER 21.

THERE has been a trifling advance in some descriptions of goods, but generally speaking much dullness prevails, and the great bulk of Apples and Peas being inferior in size and quality, the market is very heavy. Oranges from Malta and the Azores are much improved. Potato supplies are heavy, both by rail and coastwise. Quotations for vegetables are the same as last week.

POULTRY MARKET.—DECEMBER 21.

THE near approach of Christmas, and the constant fluctuations of prices at this time, render any quotations impossible. We can only say that at the time of our going to press prices were high and well maintained, and that the absence of French supplies was sensibly felt. We expect during the week that prices will be well maintained.

WEEKLY CALENDAR.

From observations taken near London during the last forty-three years, the average day temperature of the week is 43.1°, and its night temperature 31.7°. The greatest heat was 58°, on the 24th, 1853; and the lowest cold 11° below zero, on the 4th, 1867. The greatest fall of rain was 0.86 inch.

NAMING FRUITS.

BOTANISTS, in ascertaining the names of plants and flowers, proceed on the principles of a systematic science. Botany has so arranged and classified all her subjects in their minutest order, that by careful study and observation we may trace out for ourselves the correct name of any which may be brought before us, whether we may happen to have seen the plant previously or not. There are the normal conditions of plants and flowers.

the genera and species that botany tells us of, which are typical and do not vary. These, when once seen and described, can be at any future time recognised. It requires study—profound study, no doubt—but it may be and is accomplished. With the varieties of species there is far more difficulty, and there are few amongst us who will either undertake to name, or expect anyone to know, the given names of mere varieties of either plants or flowers. The Editors of our horticultural journals, who seem to know almost everything, do not attempt much with varieties, excepting in the case of a few easily-defined forms.

Pomologists, in naming fruits, have but little to guide them. There is no system yet evolved which has reduced fruits to an order by which their correct names may be ascertained. Pomology is a science, and a most intricate and difficult science, without doubt. It is a science, however, without order, or with but little. It is a science of very close observation and much varied experience—a science, the various bearings of which are much better understood than easy to explain—a science, indeed, the whole superstructure of which each one has to erect for himself by close observation, acquaintance, and hard study. There is no royal road to learning it; there is no way of becoming acquainted with fruits or of knowing them, excepting by seeing them, tasting them, examining, describing, and comparing them for oneself. It is only by the most lengthened and varied experience of each individual subject, close observation, and most retentive memory that pomologists are enabled to determine the names of fruits.

Numerous and excellent as are our works on fruits, there is none by the aid of which without previous acquaintance that we can ascertain the name of a single variety. The best work of the Horticultural Society was its "Catalogue of Fruits" out of perfect chaos. Mr. Thompson did an immense amount of good service by his classification of fruits, so far as it went, and his short descriptive notices of them. Dr. Hogg also, the leading pomologist of the present day, has done, and is doing, much to extend our knowledge of and acquaintance with fruits. His "Fruit Manual" is the very best guide we can have. We are also favoured in various ways by minutely descriptive notices, outlines of the fruits, and even coloured illustrations, and yet—look at them as we may, study, compare, commit the whole to memory if we can—without the previous acquaintance we can by no means determine the name of a single specimen. It is only by a work of years, by a long and patient study of fruits in all their varied

forms, under all their various circumstances and conditions, that one can gain a true knowledge of fruits and their correct names.

Take any one class of fruit; they are mere varieties the one of the other, each possessing its own peculiar and distinctive features and character it may be, but they are inconstant and subject to vary very much under altered conditions of soil, situation, &c. There are other varieties possessing nearly the same characteristics, which also vary so that the two seem to intermingle, and it is almost impossible to distinguish the one from the other—that is, supposing our observation is limited in extent. The varieties may be perfectly distinct and easily recognised, if grown under similar conditions, and when seen in quantity it is also a simple matter to distinguish. Take, as an example, of Apples, the well-known Blenheim Orange, and another Fearn's Pippin; no two Apples in what might be termed their normal condition could be much more distinct, and as we have them described they seem to possess no possible relationship, yet there are grown hundreds of bushels of Blenheim Oranges of the low flat form which it is most difficult to distinguish from Fearn's Pippin. The Blenheim Orange is at times small, flat, highly coloured, and dry; sometimes it is large, upright or conical, pale, and juicy. The two forms may be found in the same garden, even on the same tree. Sometimes it is the soil, sometimes the season, a little good or bad cultivation, the influence of the stock, or more or less vigour in one branch as compared with another, that will effect all this difference which one who observes alone can tell. There is no book which can afford this information. Given—a flat form of Blenheim Orange, if the observer has never seen the variety in that particular form before, there is no means at his command by which he can ascertain the name. It has simply to be arrived at by reasoning on previous observations and acquaintance, or by a reference to actual specimens. Reference to specimens assists greatly in determining, or rather in deciding, the correct names of fruits; yet if the variety is entirely new to us it is extremely hazardous to identify it by this means alone.

Fruits, however, have certain normal features which do not alter, or but little. In forming our acquaintance with fruits it is useful to mark these, and so have them well fixed on our minds.

There are other features which, being affected by cultivation and other circumstances, vary considerably; these must be taken into consideration as changeable. If we take Apples and Pears, for example, the parts of the fruit which are fixed in character, and which may be pretty well relied on as distinguishing marks, are the stalk and the eye; these, then, should always be preserved uninjured. The size of the fruit is affected by cultivation; the flavour and consistency by the same cause; the colour by exposure; and the shape is also at times altered, but more rarely. Some fruits are much more subject to variations than others, some are very uniform, such as the Golden Noble Apple, the one larger than the rest, but no other variation. There is, however, with most fruits some characteristic feature, some little peculiarity which may be noted, and

which serves as a mark for its recognition—as in the Keswick Codlin Apple, the peculiar sharp rib or angle down one side, not existing on all, but on three parts; or, in the Kerry Pippin Apple, the short slender stalk, and the little knob at one side, of its base; or in the Lemon Pippin, the shape of a Lemon, but not always or in every example. Or take the Hoary Morning, which is beautifully striped, with its thick coat of white bloom as if it had been out in some hoar frost, although this feature is at times altogether wanting; or Dumelow's Seedling with its beautiful transparent skin, its wide open eye, and acid flesh, and there is no mistaking it. Take also amongst Pears the Vicar of Winkfield. Who that has once had its peculiar twisted, squinting look—the eye looking one way and the stalk the other—pointed out to him, can again mistake it? Again, look at Knight's Monarch—round, with its short thick stalk, thick leathery skin, and the crimson shade beneath the russet; or Beurré d'Areberg with its stalk on one side, and the small eye frequently wanting entirely, like Winter Nelis in this only, entirely different in other respects. We know Beurré de Rance by its shape, eye, long stalk like a peg, and green flesh; Urbaniste by its pale green skin, its soft silky feel, and its small eye; Napoléon by its bright green colour and peculiar shape, as if it had been squeezed out by the pressure of one's hand. Nurserymen know their trees by the leaves and habit of growth better than by the fruit. Some varieties are very distinct. Joséphine de Malines Pear is easily known by its small, full, round buds and yellowish wood. The varieties of Penches are distinguished not so much by the fruits themselves as by the flowers and leaves, or the glands on the leaves, &c.; and so on.

We thus by close observation and long intimate acquaintance acquire a knowledge of the distinctive features and peculiarities of many fruits. We know some by one feature, some by another; some by taste, others by shape or form, and others again by a peculiar mark or colour. We know many, perhaps, without knowing why or being able to impart the same knowledge to others. Constant association, with keen observation, will make one an authority on fruits, whilst no amount of study without association will do so.

The naming of fruits is no light task therefore; it is a special acquirement to be able to do so to any extent. There are many who can tell the names of the few he may himself cultivate, but in general a knowledge of the names of fruits is necessarily very limited. We had a Robert Thompson and we have a Dr. Hogg, but who is there besides? We have fruit-cultivators in plenty, but where are our fruit-nomenclators, if we except the worthy Doctor? Seeing that it is only by acquaintance, by a reference to true examples of each variety, that a knowledge of fruit can be acquired, it is most important that the Royal Horticultural Society should still maintain its splendid collection of fruits as examples. In the re-arrangement of the garden I hope that this point will receive due attention. It is the most important function of the Society to keep up a correct fruit-nomenclature throughout the country.

The editors of our horticultural journals deserve much credit for their persistent endeavours to correct the names of fruit. Every week we see a long list of names given: what a time it must occupy! what a patience is required to wade through basket after basket of fruits, many of them possessing no characteristic feature! Senders can surely have little idea of the labour required and the time to name forty or fifty sorts of fruit. It is expecting too much of good nature. Having had some experience of work of this sort I speak without restraint. Senders of fruit to be named should bear in mind that the namer has no knowledge of the circumstance under which the fruit has been grown to guide him, so that mistakes will frequently occur. The specimens selected to be sent should be as characteristic of the whole bulk as possible, neither too large nor too small, and if two distinct characters are found some of each should be sent. With Apples and Pears the stalks and eyes are required, and sometimes the leaves; with Peaches the flowers and leaves; with Grapes a bunch and leaves, and the more of any variety sent the easier it is to determine the name. It is altogether absurd to suppose that anyone is capable of naming correctly small and deformed fruits. The greatest authority on fruits after all only knows a few well-defined forms in the great and extensive family of fruits. There are hundreds of fruits, especially such as Apples, Strawberries, &c., throughout the country which have no recognised names. In one locality they are called by one name, and in another something else. To this each year are added seedlings more or less distinct, all multiplying and confusing the already too numerous

varieties of fruits, and making it more and more difficult to give the name of any with certainty.—B.

THE OUT-DOOR CULTURE OF TEA ROSES.

MR. KENT (see pages 487 and 488), is blessed, for he can grow his favourites in the sunny south without winter protection, nothing more than a south wall; we in more northern latitudes are differently situated, and to leave Tea Roses without protection would be fatal—south wall or not. He has given his version, let me trouble you with mine.

During winter the bed or beds that are to hold your favourites must be prepared; any soil will not do. The best plan is to make entirely new beds annually to the depth of 2 feet, using good strong loam (sods), and rotten cow dung, with a little sand to keep it open. My plants are always potted early in November, and placed in a cold frame till January, when they are brought into a little heat. They flower early—about the end of March. After flowering give them rest; in the middle of April plant in the beds, and you will have flowers to your heart's content during the summer and autumn.

With me all the varieties Mr. Kent has named are good, and by adopting the course I pursue, even the dwarf Boule d'Or will blossom beautifully, but is always best in the bud. Gloire de Dijon we all know. A Henriette Christophe, Montplaisir, Madame Margottin, Solfaterre, Madame Bravy, Madame Willermoz, L'Enfant Trouvé, and the best, Maréchal Niel—these I cannot speak too highly of. Solfaterre is a Noisette—indeed, Noisettes mixed with the Teas do admirably together, and they being hardy will not require lifting.

In the case of Tea Roses as standards, it is always safest to lift them and plant at the foot of a wall pretty thickly, where they can have a mat thrown over their heads in severe weather, planting where they are to stand, quite at the end of March.

Those who grow the Tea Rose must not be afraid of trouble, constant attention is needed winter and summer. Keep your pruning-knife in your pocket, unless it is to take off the tops that are browned—no more. They will flower down to the tips, and in many varieties they will by autumn form creeping Roses covered with bloom.—ROSA ODORATA.

A FEW SELECT VINES.

IN writing these lines I address myself not so much to the professional gardener as to the amateur who may be desirous to grow a few good varieties of Grapes, but who, from the great number of kinds now cultivated, is unable to select for himself. The varieties enumerated below are those which will do in ainery containing plants or in a greenhouse, but whatever plants may be grown with the Vines up to the time of the Grapes commencing to colour they should at that stage be taken out. I would lay particular stress on this, as I have proved that Grapes, to be well grown and of good flavour, and to hang on the Vines, should have the house to themselves after the last swelling, and this more especially applies to the late varieties.

To those who contemplate building I would say, Build two small houses rather than one large one, because you will then always have a house to keep plants in. Thus, in the case of the early house, you may have plants in it from the end of September to the middle of June; as the heat becomes too great for bedding plants they can be taken to the late house. The Vines in the early house being pruned, cleaned, and tied down in November, they are ready for starting in the first week of January, having three weeks previously covered the border with stable dung and leaves to excite the roots into action. I am supposing the border to be outside. I find this a very useful house for propagating bedding plants, and growing Fuchsias, Azaleas, &c., till they flower. In September, most of the Grapes being cut, it is ready for the reception of Azaleas, Camellias, &c., which till then have been out of doors, but which should be under cover before the heavy autumn rains set in. Vines grown in the same house as plants require dressing twice with soft soap 4 ozs., white soap 4 ozs., and sulphur 4 ozs., to destroy all eggs of insects, it being impossible to keep them clean, and Azaleas are about the worst plants to grow along with Vines, the thrips being so hard to kill. In a future paper I will describe the kind of house best adapted for growing a large number of miscellaneous plants together with Vines.

In giving a short list of good useful Vines, I confine myself

to my own experience here, as, perhaps, those varieties which do well here may not succeed farther north. The Vines being started on New Year's-day, I cut in the first week of July good bunches of Grizzly Frontignan, a Grape of delicious flavour, and ready for table the first. The colour is objected to by many, it being neither white nor black, but red. I consider it superior to the White Frontignan. It is a good cropper, but gains nothing by keeping, as, though I cut every month up to the first week in September, those bunches cut from the same Vine in July were the best. The bunch is long and tapering, but the Grape is small both in berry and bunch. Royal Muscadine, a white Grape, is ready about the same time as the preceding, but requires to hang a few weeks. It is likewise a good early Grape, and I shall also have to speak of it in giving my late list. It is a sure fruiter, but, like the Grizzly Frontignan, small. Buckland Sweetwater is a very fine useful Grape of good flavour, also a good bearer. Foster's White Seedling is a first-class Grape, and is larger than any of the preceding; it is also a good keeper. I likewise tried the Muscat of Alexandria, but found it would not do, requiring more heat to attain perfection than I could give it, as well as to hang too long—say till November or December—while the greenhouse plants are taken in in September. Black Hamburg, a good Grape, of excellent flavour, a fine cropper, and large in the bunch and berry, with me gives way to Pope's Hamburg (Frankenthal), a thin-skinned Grape, better-flavoured than the Black Hamburg, and as good for keeping. To show that it is a good bearer I would say that on taking charge of the Vines here in 1868, I found a fine Vine, which had been planted about fifteen years, in a very poor condition; however, I encouraged it in every way possible to make plenty of wood, and a Mt Hill Hamburg next to it having died, I decided on running up a rod of Pope's Hamburg, and well it has repaid me for the room. This year I cut from it twenty-four bunches of excellent Grapes, the least weighing a pound, and I might have had more bunches had I thought proper.

Thus, for an early house, we have Grizzly Frontignan at the warm end, Buckland Sweetwater, or Foster's White Seedling, Royal Muscadine, Black Hamburg, and Pope's Hamburg; and rather than have more varieties of black Grapes in the early house I would prefer two Vines each of the Hamburg.

In the late house, in which it may not be convenient to keep up a very strong heat, I would have Royal Muscadine, a good keeper. I have now, December 10th, good bunches as fresh in the berry as in September, and the flavour is excellent. Foster's White Seedling is also good, and I would have Trencham Black in addition to Pope's and Black Hamburg, for up to Christmas there is no black Grape equal to the Hamburg. On December 10th I cut excellent examples of Pope's Hamburg. These varieties should be planted at the coolest end of the house. West's St. Peter's, a rather small Grape, but good, is the next for cutting for table. This is very prolific, and a good keeper. I have the misfortune to have a Barbarossa [Gros Guilanme] in my late house—I say misfortune, because, although a fine Grape, it requires heat. With me it is small, both in berry and bunch, but will follow West's St. Peter's; then comes Lady Downe's, and lastly Alicante. I have included the last two, as, though they require rather more heat than the rest, they can still be grown for a crop. I would add, that though this is a small list, still the varieties I have named are sufficient to meet the requirements of those for whom this paper is written.—STEPHEN CASTLE, *Bent Hill Gardens, Prestwick.*

KALES OR BORECOLES.

YOUR able papers of 1862 on the subject of Borecoles have not borne that fruit which might have been anticipated, as will be seen from the results of experiments which I carried out during the last two seasons.

ASPARAGUS KALE.—From fourteen different seed warehouses, embracing the leading wholesale and retail firms, I purchased parcels of "Asparagus Borecole." In four instances Couve Tronchuda was supplied, in five instances Jerusalem Kale; in three cases Buda Kale was given, in one instance Chou de Milan, and in another Ragged Jacks.

RAGGED JACKS.—Under this name in two cases I received Jerusalem Kale, in another a coarse-growing purple Kale, and in a fourth instance Chou de Milan. In the remaining instances I received the true Ragged Jacks.

BUDA KALE.—For this in four instances I received Jerusalem Kale, in one instance Couve Tronchuda, and in the remaining instances it was true.

DELAWARE KALE.—In eight cases I was supplied with Jerusalem Kale for this, and in one instance with Buda Kale, but in no instance with a variety to represent a distinct Kale.

JERUSALEM KALE.—In five cases I received what Mr. Cattell, of Westerham, calls Purple Jerusalem, in one case I had the Purple Dwarf Curled Kale; the remainder were the Green Curled Jerusalem.

LAPLAND OR SIBERIAN KALE.—In one case I received Egyptian, in another Buda, and in a third Dwarf Purple Curled Kale.

CHOU DE MILAN.—There was a wonderful unanimity in this. Only in one instance did I get a different thing, and that was a green variety of Couve Tronchuda.

RUSSIAN KALE was a mixture of Buda and Jerusalem Kales.

EGYPTIAN KALE.—Very few offered this, and these seemed to be of one mind.

MILLER'S WINTER KALE proved to be Egyptian.

VICTORIA MARROW KALE turned out to be Couve Tronchuda.

CAMBERWELL KALE proved to be Ragged Jacks.

COTTAGERS' KALE.—There was no diversity of opinion as to this.

ACME KALE proved to be Jerusalem.

BUCKMAN'S HARDY WINTER GREENS.—This differs from anything I grew, and seems a sturdy plant, which is likely to stand the severest winters, and gives plenty of green food, but I can say nothing of its cooking qualities, not having tasted it yet.

CURLY GREENS, GERMAN GREENS, SCOTCH KALE.—There appears to be a great disposition here to multiply names. I had Prince of Wales, Tall Green Curled, Feathered Scotch, Abergeldie, Handsworth, Superb Tall, Superb Parsley Curled, Williams's Matchless, Pontefract Green Curled, Tynningham Green Curled, Williams's Dwarf Green Curled, Veitch's Dwarf Late Curled, Dwarf Curled Canadian, Moss Curled, Stuart and Mein's Extra Curled, Dickson's Imperial Dwarf Curled, &c. These were simply variations in the selection. Some few differ in the shade of green; but none of them possessed that pro character which long ago I was taught to believe that the fairies rode upon in Ireland, and to my personal knowledge and experience the lads and lasses in Scotland go after, on Hallowe'en, to see what luck they will have in a husband or a wife.

Having pointed out the inconsistencies which exist amongst those who sell Kale seeds, I hope you will do something, either in the way of illustrations, or such full explicit descriptions affixed to the names as will give the seedsmen a chance of starting fairly. I need not say how unsatisfactory it is to send to your seedsmen for one thing, and receive something the opposite of what you want. I might touch upon other Kales, such as the Lanthis, Flanders, Thousand-headed, Jersey, Brown, Palm Kale, and many others, but these are not so prominent in our seedsmen's catalogues, nor such confusion in the names, so that we may leave them to be dealt with in a descriptive list of Kales. Those I have treated of are what might be termed the domestic Kales, and it is desirable, for the sake of the gardening community, seedsmen should have some unanimity touching the application of their names.—**AMATEUR.**

POTATO SETS.

ON page 389 of your Journal, "CALGARIA" gives his experience in planting Potatoes, and asks for that of some of your correspondents. I will give you mine during the past season.

I bought 6 lbs. of the Early Rose Potato from one of the London nurserymen, numbering twenty-four Potatoes. Twelve of them I cut into sets; I planted them 2 feet from row to row, and 1 foot from set to set. The remaining twelve I planted whole, in a row 2 feet from the others. In the autumn the produce from the sets was one bushel, from those I planted whole not quite half a bushel; so that had I cut the whole of them, the produce would have been two bushels, instead of one bushel and a half.—**T. C. W., Royston.**

SETTING OF GRAPES.

MANY papers have been written on this subject, and very opposite opinions expressed. I have seen a dry atmosphere, a damp atmosphere, a high temperature, and plenty of air, all recommended in turn to insure Grapes setting well. As is known to many of your readers, I have been crossing Grapes rather extensively the last few years, and have, I think, collected a few facts.

The first deduction I have made is that no treatment can be

expected to give the desired result to a mixed collection of bad-setting Grapes, because bad setting springs from various causes. To illustrate this, take two well-known Grapes—Black Morocco and Canon Hall Muscat, two of the worst-setting Grapes known. The cause of Black Morocco not setting is that the anthers curl back at the moment the flower opens, and it is a mere chance if it is self-impregnated; but if you apply pollen artificially every berry will set. With the Canon Hall Muscat the pistil appears in fault, the end always seems wet; and even the pollen of other Grapes applied to it artificially has not with me always insured its setting. Now in this case one can imagine a high temperature beneficial. Then, again, I have seen Trentham Black badly set in a warm house, and every bunch perfect in a cold orchard house.

I have lately come to the conclusion that no treatment can be the very best for each individual of a mixed collection of Vines. Perhaps this is the reason why we find good gardeners famous for the cultivation of particular kinds of Grapes, one for his Muscats, another for his Hamburgs, &c. Now where great success has been attained, how interesting it would be if we could learn the treatment in each case! What light might not be thrown on the peculiarities of each variety! With me Mrs. Pince's Muscat formed beautiful bunches, and set almost every berry. It had plenty of air on sunny days, a good heat, and the flowers were gently touched with a brush nearly as thick as a wrist, made of camel's hair. The same treatment gave me splendid bunches of my favourite Grape, Muscat Hamburg, weighing from 5 to 6 lbs., yet in the same house Trentham Black set badly. I think Mrs. Pince will yet be a favourite as a late-keeping Grape. It improves in flavour by hanging, and in a damp house full of Geraniums, where even Lady Downe's rots badly, it is as perfect in appearance as it was three months ago.

Another fact, I think, is proved by my experiments; it is that every crossed seedling shows by its foliage it is crossed; and I think I have also proved that to cross Vines is not quite so easy as many people think. I look upon Golden Champion as being an uncrossed seedling from Canon Hall Muscat, because no one can distinguish them by growth or foliage; and from the great similarity in everything but colour, I should say the White Lady Downe's was also an uncrossed seedling of the black Lady Downe's. It is well known colour in seedling Grapes is quite accidental, white ones bringing black ones, and *vice versa*.—J. R. PEARSON, *Chilwell*.

ELSHAM HALL, LINCOLNSHIRE.

THIS, the seat of Colonel Astley, possesses amongst many others the advantages of a double access by rail. From the Brigg station it is approached by the uninteresting North Road, which, skirting the "Cars"—rich low-lying alluvial flats—for some three miles, branches through the park, and by an avenue of young Elms brings you circuitously past the dairies and aviaries to the Hall. From Barnetby station on the east, distant some two miles, one is brought through the village of Elsham, which nestles in a sheltered corner on the southern declivity of the Wolds. All here, save the ancient church (shortly, it is to be hoped, to participate in the general renovation), speaks of prosperity and comfort; the substantial houses of wealthy farmers, and the cottages of the labourers with their trim gardens, kept with a neatness and pride which does them credit, indicate the interest of a generous squire. Either route brings you to the Hall door. Looking to the north there is an expanse of grass, covered in spring time with Crocuses, Snowdrops, and Daffodils, backed by a sheltering wood of splendid Sycamores, Walnuts, Scotch Firs (one remarkable for magnitude and beauty), Oaks, and Elms, in which the rooks, which, doubtless, supplied the motto of the ancient Corbet family, "*Deus pascit corcos*," have for centuries reared their young. The mansion belongs to that period of architecture when houses were built to live in and not to look at. It is remarkable for hospitality without humbug, as being one of the few country houses where they brew their own beer, and one of the fewer still where they brew it good.

We pass on to the gardens. On the east and south of the mansion there is a broad expanse of beautifully-kept lawn, relieved here and there with forest trees and the deep foliage of the Yew, separated from that on the north by an caken rustic fence, profusely covered with creepers, extending from the north-east angle of the house to the orangery. The whole of the lawn is separated from the park by a semicircular sunk

fence, so that looking from the drawing-room windows towards the east the eye wanders over an undulating park, stretching far along the southern face of the Wolds, fringed entirely with woods, and dotted here and there with venerable Ash and other forest trees. In the foreground is a new geometrical garden, designed and laid out with great skill, and planted with equal taste, by Mr. Gardner, who takes as much interest as his master in all the improvements and new beauties of the place. The individual beds are beyond a brief description; suffice it to say they encircle an elegant fountain, amply supplied with the brightest water from the northern hills. Looking to the south, a mass of huge Sycamore trees conceals the stables, kennels, home-farm buildings, workshops, &c., and fringes the one side of a small lake; the opposite is adorned with a long terrace, decked with variegated Ivies, Jasmine, Cetonasters, Honeysuckles, and Roses, which droop to the water's edge, whilst from scores of vases huge Scarlet Geraniums seemed to pour a blaze of light. This is one of the prettiest views I know. Standing on the lawn the eye is carried down the lake; on the left hand a gentle slope of grass dotted with the Sycamores, on the right the long line of terraced flowers, whilst an island at the end partially intercepts the view, which, resting awhile on a second lake, dies away in the distant park.

To reach the kitchen garden we cross the little brook at the head of the lake, and skirt its western side along a trim gravel path leading to a garden embowered in trees, open only to the south-east—a large grass plot with beds of varied shape, surrounded by a gravel path; a comfortable summer-house at the more northern end, a rustic bridge at the other. In this garden, beyond everything being very good of its kind, there was nothing remarkable, save one circular bed, the centre being Palma Christi, 7 feet high, surrounded by *Canna grandis*, this again by *Veronica Andersoni variegata*, edged with Prince of Orange Calceolaria, forming altogether a dome of foliage and flowers which I have not seen surpassed.

Crossing the bridge, which partly forms a boathouse, we stand upon the terrace, some 150 yards in length. Here the walk diverges right and left. On the left is the long terrace on the lake, in the centre a lawn cut into suitable beds, filled with bedding plants and other flowers, perfect in vigour and harmony of colour; on the right the other path is flanked by a ribbon border, and a wall extending on one side of the kitchen garden covered with well-trained fruit trees—Figs and Pears. In the middle of this wall there is an arched stone gateway and a beautifully wrought-iron gate, corresponding well with the scrolls and wreaths of Roses remarkably well carved in Ancaster stone.

This brings us to the central walk of the kitchen garden opposite, to the right and left being the rows of houses, forcing-pits, frames, &c. This garden is nearly square, surrounded by walls—such walls! 15 feet high, 2½ feet thick, coped with Yorkshire flags 3½ feet wide and 4 inches thick. These walls are covered with fruit trees, well trained and in full bearing, the southern inside wall mostly with Peach trees, protected with one long length of frigi-dimo, and I quite envied the facility with which a man ascended a ladder, walked along the coping, and raised the protector. A wide south border is lightly cropped with early vegetables, which are yet further coaxed by means of "cloches," an invention of which Mr. Gardner certainly approves for particular purposes. The potting houses, fruit rooms, &c., are at the north side of a wall.

Against its opposite side leans, in melancholy decrepitude, the ancestral vinery; paint, putty, and wood seem to have long since struck work. The Vines appear to have been trained on the "anyhow" system, yet even here skill and attention have educated a fair crop of Grapes, despite constant drip and uncontrollable ventilation. What a change when we pass hence to the Peach house and new range of vineries! Perfect houses and perfect trees; wood of equal growth and vigour, short and well-ripened, full of those delightful triple buds. In bloom and in fruit I saw them equally beautiful. The new vineries, 90 feet long, heated by a tubular boiler, were erected by Gray, of Chelsea, in three compartments, and have outside and inside created borders, with a space outside and in, to be filled up as the Vines require it. As at Garston, the bottom of the border is level with the surface of the garden; total width 21 feet, 4 feet thick, with a fall of 15 inches. The Vines are but young, and look as well as possible. The forcing house, Melon and Cucumber houses, and a range of raised pits, all heated by one saddle boiler, were well occupied, and extremely clean and tidy. A new Mushroom house was being

erected, with very well-arranged cast-iron supports for the 1½-inch red deal floors and fronts, which, fitting into grooves and being moveable, afford great facility in cleaning and renewing. This arrangement, executed by Bevitt, of Pontefract, is well worth the attention of anyone; a trifling alteration would make them perfect. Forced vegetables, required in great quantity, are produced of excellent quality, whilst the main crops, skilfully attended to, grow to prodigious size in the rich humid soil of the garden, into which abundance of water is introduced by pipes communicating with the lake. I noticed particularly Cottagers' Kale, some 4 feet high, each large enough to satisfy half a dozen "chawbacons;" Cardoons in great perfection, which Mr. Gardner purposes to utilise in the shrubberies as winter foliage plants; and healthy rows of Ne Plus Ultra Peas, which (at the end of October) were as good to eat as they were to look at.

After all, I am nearly omitting the chief thing which made me write—the removal of some old fruit trees. It was desirable to widen the centre walk, and to do so it was necessary to transplant in November, 1868, some espalier Pears and Apples, which measured 33 inches in circumference, and extended their branches 14 yards. In 1869 they looked very sickly, in 1870 they bore an abundant crop, having quite recovered their removal. Mr. Gardner attributes his success to very carefully forking up the roots, plentiful mulching, and abundant water. The result should encourage all who need it to make the attempt to save such fine old trees, and forbid us to accept as impossible an operation we have never carefully tried to execute.—C. C. E.

MAIZE.

[The following paper, forwarded to Dr. Masters for presentation to the Royal Horticultural Society, was read at the General Meeting on the 7th inst., in illustration of the collection of Maize exhibited by the Rev. T. C. Bichaut.]

THIS collection of Maize exhibited has been formed from various sources, but mainly from a selection from the splendid varieties shown in the American section at the Paris Exhibition of 1867. As this was an unique occasion, and specimens from every known variety of a country having such a wide range of climate, and one where the plant is so generally cultivated, were present, this would, of itself, commend the collection to European notice. Since that time seeds from other parts of the world have been procured, and an exchange effected with Messrs. Vilmorin, of Paris, who have devoted considerable attention to the culture of Maize, the use of which is becoming very popular in France.

An experience of three very dissimilar seasons has been gained since 1867. A certain number of varieties have been discarded, either as too small, too coarse, or as ripening at too late a period of the season to make them generally serviceable. It was to be expected that the sorts which ripened the earliest would become most in demand, but there were other conditions to be fulfilled before Maize could be able to hold its ground against so many new and known vegetables. It was not so much a variety which should serve for cattle, or poultry, or even for grinding into flour, which was required, for such are now commonly imported more cheaply—at least so it seems at present—than they can be grown in our climate; but it was sought to popularise the manner of eating Maize so common in the States of America, and in other regions of the world (including even Southern Europe), as "green corn"—i. e., in a semi-ripened condition, when the grains had acquired the consistency and size of good Marrowfat Peas. The addition of a table vegetable of this delicious and nutritious nature—the food of millions of the human race—and yet, for want of experience of the sorts adapted to our climate, so strangely unappreciated here, seems of no inconsiderable importance, the more so as it ripened in the late autumn, reproducing then the best flavours of the early Pea and of the Asparagus. For this the ordinary yellow Maize is not suited, so that its culture becomes of little value. But the collection here exhibited claims not only to be the most complete which has probably ever been presented in Europe, but it also shows varieties which greatly excel the Maize known in this country and in France in size and in flavour, while they still fulfil the special conditions required in earliness. More than this, these ears are grown from seeds acclimated by three varied seasons in the Channel Islands, and are even immediately sprung from seeds of plants growing in the damp and sunless season of 1869, which plants were prostrated to the earth when at their fullest and most critical season of growth, on September 12th, under the weight of a hurricane of 55 lbs. pressure per square foot. The perfectly ripened specimens exhibited attest the vitality of Maize when treated with common care. Remarks on the different kinds will best be made as each is examined. A few observations must now be made on the

Uses of Maize.—It would be without interest here to speak of the numerous purposes to which this most valuable plant is put, when in a dried state, in tropical regions. The drought of past seasons shows the need of adding to our resources, if possible, whatever green fodder

can be grown. There are certain kinds of Maize better adapted by their growth than others to fulfil this object, being hardy and rapid in increase, and at the same time abounding in saccharine juices, which animals will devour greedily. Even the stalks when hard can be utilised by slicing them, so that there is really no waste. Mention having been made of these varieties in the French scientific journals, a pressing request was sent here for a large quantity of seed for Brittany, there to be cut down and used as forage during the drought.

Culture.—The seeds should be sown in common raising boxes during April—early in the month in the south, and later in the north of England. In the Channel Islands they were sown in boxes very early in April, and planted out three weeks after. These boxes should be placed in a cool viney, orchard house, or pit, and the plants hardened off before planting. This would be best in May, earlier or later according to the season or locality, which a short experience would decide. The risk of the young plants is common to other vegetables—that of suffering from spring frosts; a little protection would obviate all this. But this season Mr. Dancer, of Chiswick, we are told, sowed a quantity of Maize in the open ground in March. It was cut down by the frost, sprang up again from the root, and yielded a heavy crop.

By the end of July our Maize plants were already 7 feet high, and were then secured from high winds by stout stakes at intervals, and thin cords stretched between them, to which the rows were easily tied. Not being able to give waterings, which materially aid the growth of a plant which luxuriates in the rich alluvial valleys of tropical countries, we had planted in shallow trenches filled with manure, and 3 inches of soil above it. These trenches retained the casual showers, and were gradually earthed in, as for Celery. The manure kept the roots perfectly fresh, and two light waterings of liquid manure were given during the very dry summer. This attention is not greater than is always given to Peas and other vegetables. Failures are traceable to a neglect either of some, or even of all, of these means.

It is not quite so easy to ascertain the exact time to take the ears as "green corn" for the table. A day or two makes considerable change in their consistency. When as large and as hard as Marrowfat Peas, from twenty to thirty minutes boiling is enough. Serve with fresh butter to spread over them, and they are thus ready. All the uses made of Peas for soups and stews are common to green Maize. The ears can also be roasted before the fire. When dry, these fine white varieties would produce very pure flour for puddings, &c.

Maize, in our climate, requires five months to mature the seeds for sowing, being one month more than in California. Some sorts ripened here in August. The stalks reached to 10 feet, a height only excelled in rich tropical soils. Where several sprang from the same root, the ears ripened sooner. Experiments were made in hybridising, with some results, and also in mutilating the male panicle of flowers with a view to increase the size of the ear. After several generations of mutilated plants had been experimented upon, it was found that the ears were increased sensibly in size. The produce of seed was at the rate of ninety-five bushels the acre, gathered as it was, not from selected plants, but from numerous varieties, some being too small.

Remarks on the Varieties.—Nos. 1, 2, 3, and 4 are specimens of the best pure white Maize from Georgia. This is the most delicate for table use; ripened this season at the end of September, and is an early sort, and the most valuable in every respect. No. 4 of these has spiky grains, and is even whiter than the others.

No. 5, King Philip, from M. Vilmorin; considered a good kind in France.

Nos. 6, 7, and 8, are "Flint Corn," very much like that grown near Bordeaux, but superior. No. 6 of these is a free-growing and valuable table Maize.

Nos. 9 and 10 are "Pink Corn." The first of these is a remarkably fine specimen, and this variety is earlier than the pure white, is delicate in flavour, and more valuable than No. 10.

No. 11 is the Giant Red, the largest of all, excellent, and a mid-season sort.

No. 12 differs from this in having smooth grains.

No. 13, Jaune Gros, from Vilmorin. This is much grown in the Touraine, and is the cheapest of all, but rather too coarse.

No. 14, A striped yellow originally from Paa, and raised from seed from plants grown in Yorkshire. A hardy and valuable kind.

No. 15, True "Yellow Pop Corn," from America. A very excellent kind, prolific and early; will be very useful for forage also.

No. 16, Jaune d'Annonce, early, and good for grinding purposes.

No. 17, Improved Common Yellow, an excellent kind, raised here, and larger than the common one.

No. 18, A small, late, yellow Maize.

No. 19, A handsome and heavy spotted Maize, raised here this season in some quantity.

Nos. 20, 21, 22, 23, 24, and 25, are hybrids of various shades, easy to retain pure. An opinion as to the best would be valuable.

No. 26, A short corn; spiky.

No. 27, A new African Maize from Italy, very hardy and prolific, likely to be very useful.

No. 28, Handsome hybrid of this year—mid-season.)

No. 29, Darkest ear ever raised here.

No. 30, "Blue Corn," very difficult to ripen. One, more handsome, has disappeared from culture here; another has magnificent gold-striped leaves, with dark, hirsute stem,—equals the Japanese

Variegated Maize for gardens, and is 9 feet high. Of this valuable kind only a few seeds exist here, and no ear.

No. 31. Early White "Pop Corn." Dwarf, and carious, not being so profitable for a sweet meal as No. 15.

No. 32. Boston Ten-weeks Maize. It excels the French Ten-weeks somewhat, but both are too small.

No. 33. Small-seeded red. Curious, and difficult to ripen.

No. 34. A similar variety; generally of the present size.

No. 35. Large pale red.

It remains only to add, that seed for sowing can be obtained in gardens in warmer districts, and always from such places as the Channel Islands; while Maize, to be eaten green in the autumn, can be grown anywhere with common attention. The same may be said of its use for forage.—TH. C. BREHAUT, *Richmond House, Chertsey.*

ENTOMOLOGICAL SOCIETY'S MEETING.

The December meeting of this Society was held at Burlington House, the President, A. R. Wallace, Esq., being in the chair. Amongst the donations to the Society's library were the "Memoirs of the Society of Naturalists of Moscow," and other serial works.

Mr. Edward Saunders exhibited three species of Hemipterous insects new to the British fauna, *Salda arenicola*, from Bournemouth; *Plociomerus luridus*, from the New Forest; and *Hadrodema Pinastri*, from the neighbourhood of Reigate; also a series of continental species allied to *Strachia festiva*, in order to clear up the synonymy of that insect. Mr. Pascoe exhibited two new species of Longicorn Beetles from the Himalayas, collected by Captain Lang, forming two new genera. Mr. F. Smith exhibited two small species of Beetles new to the British list, collected by Mr. Champion—namely, *Culodera rubens*, from Lewisham; and *Baridius scolopaceus*, from the coast of Kent. Mr. Butler exhibited a very minute specimen of *Vanessa Urtice*; it was one of the second brood, and had the hind wings very dark coloured. Mr. Albert Muller exhibited a series of photographs of remarkable kinds of Galls, caused by different species of Rhodites and Cynips, chiefly upon Oaks in North America, which he had received from Mr. Passett, of Waterbury, U.S. Mr. Sydney Saunders exhibited a living specimen of the remarkable *Eresus Ctenizoides*, a very large Spider of a black velvety colour, with a flattened abdomen, which is surrounded by a bright red band. It is a native of Syra, in Greece, and feeds upon large Grasshoppers, but it had remained without eating since July last. Mr. F. Smith stated that the Grasshoppers in this country are attacked by a large silvery species of *Asilus*, which preys on them and carries them off.

The commencement of an elaborate memoir on the family Ephemeridae, or May Flies, by the Rev. A. E. Eaton, was read. The author has devoted much attention to the minute anatomical characters and transformations of these interesting insects, of which he has described 178 species, British and foreign, a great number of which are new to science.

SALES AT COTTAGE GARDEN SHOWS.

"HORTUS" would find it a good plan to announce to visitors at the cottage garden shows, before the prizes are distributed, that it is very important to the exhibitors to sell their produce, and for that purpose, immediately after the distribution of the prizes, the exhibitor will return to the tent, and gladly sell to anybody who will purchase. The plan is sometimes adopted of putting the value on a card. This is convenient, as, if the owner is away, the willing purchaser can write his name on the card.—THOMAS COX, *President of the Nutfield and Betchingly Cottage Gardeners' Show for 1870.*

I SUGGEST that the cottagers should affix the price of their commodities. Persons wishing to buy will see at once the price; then "first come, first serve."

Tea Rose Madame Levet (see page 487) is here, but I have not proved it.—W. F. RADCLIFFE, *Okeford Fitzpaine.*

PRUNING ORNAMENTAL TREES AND SHRUBS.

No. 7.

THE groups dividing flower gardens or pleasure grounds and parks, or those planted for shelter or other objects, afford scope for a display of trees and shrubs on the massing system quite as well as, or even better than a group to which access can be had from all sides.

Fig. 1 is a group of this kind planted as a division between the park and pleasure ground, which are separated from each other by iron fencing. *a*, Cupressus Lawsoniana, and the dots on the margin are of it and its varieties; *b*, Rhododendron ponticum; *c*, Deodar Cedar, on raised ground; *d*, Cotoneaster irigida; *e*, Ghent and English varieties of Azalea pontica; *f*, English Hollies (Ilex Aquifolium, and vars. femina, flava, and angustifolia); *g*, Berberis Aquifolium; *h*, Andromeda

floribunda; *i*, Cupressus Lawsoniana, with a few dotted on the margin; *j*, Menziesia polifolia alba; *k*, Berberis Darwini; *l*, Azaleas, with *A. amona* in front; *m*, Wellingtonia gigantea; *n*, Irish Yews; *o*, Pinus excelsa; *p*, Rhododendron, varieties; *q*, Portugal Laurel; *r*, Aucuba (old variety); *s*, Sweet Briar; *t*, Lime; where crossed filled in with Ligustrum ovalifolium, and yellow-berried Ivy; *u*, Black-leaved Laurustinus (Viburnum latifolium); *v*, Silver Fir (Picea pectinata); *w*, Purple Beech, filled in with Cobelian Laurel; *x*, Horse Chestnut, filled in with English Yew; *y*, Laburnum, filled in with Cotton-easter Simmondsi, and *C. microphylla*; *z*, Scarlet Thorns.

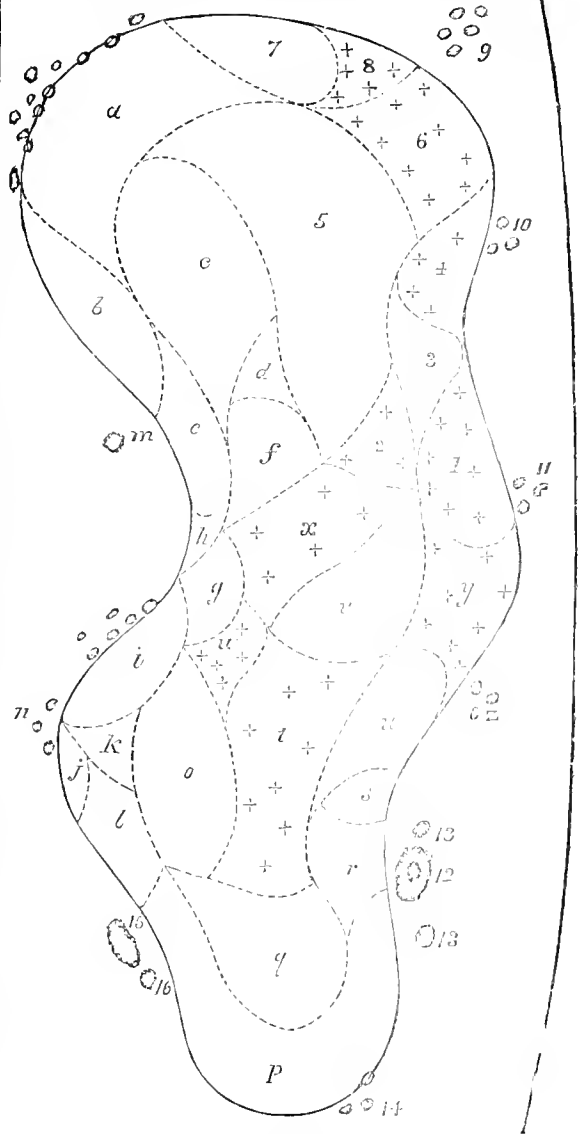

Fig. 1.

1, Lilacs, filled in with Berberis dulcis; 2, Mountain Ash, filled with Alexandrian Laurel (Ruscus racemosus); 3, Broom, of sorts; 4, Guelder Rose, with Mock Orange and Periwinkles intermixed; a few Vinca elegantissima on the margin; 5, Austrian Pine; 6, Scarlet Maple, filled in with common Laurel; 7, Hemlock Spruce; 8, Red-berried Elder, filled in with Berberis Aquifolium; 9, Pinus Cembra; 10, Pink Thorns; 11, White Thorns; 12, clump of Double Gorse; 13, Pampas Grass; 14, Variegated Hollies; 15, clump of Broad-leaved Holly, Ilex Hodginsi, and I. altacronsis; 16, Tritoma Uvavis.

Again, Groups in park scenery need not be of the species or varieties forming a genus, but may be variously planted, but still adhering to the massing system.

Fig. 2 I shall presume to be groups of this description. *a*, Sycamore, filled in with common Laurel; *b*, Austrian Pine; *c*, Spanish Chestnut, filled in with *Berberis Aquifolium*; *d*, Larch; *e*, Scotch Fir; *f*, Larch; *g*, Wych Elm, filled in with Evergreen Privet; *h*, Austrian Pine; *i*, Norway Maple, filled in with common Laurel; *j*, Turkey Oak, filled in with *Berberis Aquifolium*; *k*, Scotch Fir; *l*, Lime, filled in with common Laurel; *m*, Corsican Pine; *n*, Larch; *o*, Walnut, filled in with Evergreen Privet; *p*, Austrian Pine; *q*, English Oak, filled in with *Berberis Aquifolium*; *r*, White Thorn; *s*, Lombardy Poplar; *t*, Lilac; *u*, *Rhus Cotinus*; *v*, Laburnum; *w*, Mountain Ash; *x*, *Rhus typhina*; *y*, Horse Chestnut; *z*, Variegated Sycamore.

and then, though there may be considerable variation in the subjects and mode of placing them, there is but one result, a sameness in every part of the group or plantation.

As regards the dotting of trees singly at regular or irregular distances, as may be seen in almost all our parks, I have but little to say. There is something in having a well-wooded park or country to drive through and look at, but would anyone advise planting an open space on such a principle—if principle it be—as is presented in almost all our parks? It would be wrong to say a word against the fine trees to be found in our parks; but there are numbers possessed of no beauty, and to cut them out would improve the effect of those left, and allow of their broad distinctive features being seen to advantage,

Fig. 2.

1, Purple-leaved Sycamore; 2, Scarlet Maple; 3, Lucombe Oak; 4, Purple Beech; 5, Lime; 6, Scarlet Oak; 7, Beech; 8, Scarlet Thorn; 9, Holly; 10, Exeter Elm; 11, Austrian Oak.

besides affording space for other and better subjects than those removed. This would destroy to a great extent the monotonous appearance of our park scenery, the new plantations being in masses, with open glades of grass of considerable but variable lengths and breadths.

In arranging shrubs in groups or shrubby borders there can be no question that of all the systems the massing is the best.

Suppose *fig. 3* to represent a shrubby border, which it is customary to plant in mixed order, then—*a*, Chinese Arbor-Vitæ; *b*, Gold-leaved Holly; *c*, *Rhododendron catawbiense*, vars.; *d*, *Phillyrea oleaefolia*; *e*, *Azalea pontica*, vars.; *f*, Guelder Rose; *g*, *Kalmia glauca*; *h*, *Berberis empetrifolia*; *i*, *Syringa* or Mock Orange, double-flowered; *j*, Green Hollies; *k*, *Deutzia gracilis*; *l*, *Aucuba femina limbata*; *m*, Scarlet Thorn; *n*, *Weigela rosea*, with the dotted space its variety *variegata nana*; *o*, *Berberis Darwinii*; *p*, Portugal Laurel; *q*, *Spiræa Thunbergi*; *r*, Scotch Laburnum, with Colchian Laurel; *s*, *Cydonia japonica*; *t*, Silver Holly; *u*, *Laurustinus*; *v*, Ribes, vars.; *w*, Lilacs; *x*, Double Gorse; *y*, *Kalmia*; *z*, Scarlet Rhododendron, and hardy Heaths.

1 and 8, *Kalmia latifolia*; 9 and 10, *Rhododendron*; 2 and 7, *Yucca recurva*; 3 and 6, *Andromeda floribunda*; 4, Tree Pæony; and 5, *Rhus glabra laciniata*.

Small groups on grass in pleasure grounds, it is scarcely necessary to say, should be of one species or of varieties of one species, but for effect those with distinct colours of foliage or flowers may be disposed in one part, and others of a different colour in another part.

Fig. 3.

The preceding examples are not given as the best arrangements of trees and shrubs that can be made, but the sketches with which I have illustrated these papers, together with the remarks which I have made, may lead to more attention being directed to the subject, and to more imposing groups being planted, for I am convinced any departure from the present mixed confused distribution is an improvement.—G. ABBEY.

I think sufficient examples have been given to show the difference between the present mixed system and the but-little-practised massing one. I may be told that the massing system does not require a great variety of trees, or that I have cut up the groups into a great many fragments. My object has been to exhibit what a great variety the massing system is capable of producing even in one group; but will anyone tell me it will have that weary sameness of effect as if they were disposed at random? I believe each subject will appear in character, each exhibit a mass of foliage that will make it an object; but this is not the case when the subjects, however well chosen, are disposed in mixed order, the deciduous mixed with the evergreen, the object being to produce as much variety as possible;

THE ORIGIN OF SOILS.

If we dig down through the soil we come sooner or later to the solid rock. In many places the rock reaches the surface, or rises in cliffs, hills, or ridges far above it. The surface, or crust, of our globe, therefore, consists everywhere of a more or less solid mass of rock, overlaid by a covering—generally thin—of loose materials. The upper or outer part of these loose materials forms the soil.

The geologist has travelled over a great part of the earth's surface, has examined the nature of the rocks which everywhere repose beneath the soil, and has found them to vary in appear-

ance, in hardness, and in composition, in different countries and districts. In some places he has met with a sandstone, in other places a limestone, in others a slate or hardened rock of clay. But a careful comparison of all the kinds of rock he has observed has led him to the general conclusion that they are all either sandstones, limestones, or clays, of different degrees of hardness, or a mixture in different proportions of two or more of these kinds of matter.

When the loose covering of earth is removed from the surface of any of these rocks, and this surface is left exposed, summer and winter, to the action of the winds, rains, and frosts, it will be found gradually to crumble away. Such is the case even with many of those which, on account of their greater hardness, are employed as building stones, and which, in the walls of houses, are kept generally dry; how much more with such as are less hard, or lie beneath a covering of moist earth, and are continually exposed to the action of water. The natural crumbling of a naked rock thus gradually covers it with loose material, in which seeds fix themselves and vegetate, and which eventually form a soil. The soil thus produced partakes necessarily of the chemical character and composition of the rock on which it rests, and to the crumbling of which it owes its origin. If the rock be a sandstone, the soil is sandy; if a claystone, it is more or less stiff clay; if a limestone, it is more or less calcareous; and if the rock consist of any peculiar mixture of these three substances, a similar mixture is observed in the earthy matter into which it has crumbled.

Led by this observation, the geologist, after comparing the rocks of different countries with one another, compared next the soils of various districts with the rocks on which they immediately rest. The general result of this comparison has been, that in almost every country the soils have as close a resemblance to the rocks beneath them, as the loose earth derived from the crumbling of a rock before our eyes bears to the rock of which it lately formed a part. The conclusion, therefore, is irresistible, that soils, generally speaking, have been formed by the crumbling or decay of the solid rocks; that there was a time when these rocks were naked and without any covering of loose materials; and that the accumulation of soil has been the result of the natural detrition or slow wearing away of the solid crust of the globe.—T. JONES.—(*English Mechanic and World of Science*.)

CYCLAMEN PERSICUM CULTURE.

Your correspondent "W. Scott" (page 493), wishes for information respecting the early blooming of *Cyclamen persicum*. I sowed a packet of Wiggins's strain, on February 26th of the present year, in a seed-pan, which I plunged in a Cucumber frame then at work. The seedlings appeared by the end of March, were pricked out into pans as soon as large enough to handle, and placed again in the frame near the glass. They were potted-off singly into 60-sized pots by the end of May, were kept growing, and were shifted into 5-inch pots by the end of June; they were then placed in a cold pit and shaded from strong sun. By the middle of August I gave some of the largest another shift into 6 inch pots. They were kept in the cold pit until the end of October, when they were removed to a cool vinery, and were then showing plenty of bloom buds. On the 6th of December I introduced them into a vinery where the vines were just started, and they are now (December 26th), just ten months after sowing the seed, blooming beautifully, with flowers of several shades from white to red. I believe, had I kept them warmer in the autumn, the period would have been reduced to nine months.

The soil I used, which was always warmed before potting, was equal parts of half-rotted turf and well-decomposed cow dung, with a good mixture of silver sand. They were sprinkled overhead every morning with water from which the chill was taken.—H. HARRIS, *Naseby Woolleys*.

I FOLLOWED directions given in the Journal two years ago, and have been tolerably successful, though my gardening means and appliances are very limited. In March, 1869, I sowed a packet of Wiggins's seed. Out of the packet I had thirty plants. As soon as they showed their second leaf I repotted them, placing them three in a pot, in 3-inch pots. I kept them in fair bottom heat all through the summer, but did not renew in the autumn the dying heat of the frame they were in. They grew remarkably well, and came into blossom at Christmas, giving about five blossoms on each plant. I kept them

in their pots till May, when I turned them into the open ground of a spent cutting frame. There they continued till September, when I potted them three in a pot as before, in 6-inch pots, and the largest in separate 4-inch pots, and put them in gentle bottom heat. They are now coming into nice bloom. One is on my table as I write, a single plant with forty blossoms expanded and expanding. Some of the pots have between seventy and eighty blossoms coming on.

They would, I am sure, have blossomed much more freely the first year if I had kept them in constant bottom heat. They are flowers most valuable to those who like winter plants in sitting-rooms. They seem to suffer less from long continuance in hot rooms than any plant I know, except, perhaps, Palms, and even before they are in bloom their beautifully marbled leaves make them delightful objects. I had not much variety of colour in my packet of seed.—Q. Q.

LATE PEAS.

I FIND Mr. Castle (page 324) puts Veitch's Perfection in the wrong place. *Ne Plus Ultra* is the best suited for Prestwich, and is mostly grown as a late Pea, being more hardy than Veitch's Perfection. There is a late Pea called Swinton Cottage, a local name; it was raised by the late Dr. Robinson, of Swinton Park, is a late wrinkled Marrow, sweet-flavoured, and for a late or general crop is first-rate. I saw it myself after the frost in November, and tasted it before the frost, and the flavour was excellent. Many of the gardeners in this neighbourhood gather it when frost shows itself, and spread the pods out on a cellar flag, and by that means they last fully two weeks longer than if left out of doors. All the gardeners in this part try to have Peas as late as possible. I have seen them myself this season, late in November, until the frost cut them down.—SAMUEL PORTER, *Prestwich*.

INTENSE COLD.—I forward you the readings of the thermometer during Friday, Saturday, and Sunday night, as it may be interesting to know how other districts were affected. On Friday night (Dec. 23rd), at 11 30, the thermometer marked 3°, or 29° of frost. At 6 A.M. on Saturday it was 5° below zero [?]; at 10 A.M., with a bright sun, it was down to 10°, or 22° of frost; at 12 it was 23°; at 2 P.M. it was 21°; at 5 P.M. it was down to 5°; at 8 it was down to 3°; at midnight it was 2°. At 6 o'clock on Christmas morning it was 3°; at 10 it was 6°; at 5 P.M. it was 13°; from which time till 9 o'clock on Monday morning the temperature gradually rose to 33°. The rime on Christmas morning on the trees was magnificent.—J. PLATT, *Gardener to Sir W. Folkes, Bart., Hillington, Norfolk*.

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 1.

OCCASIONALLY in some of our country towns where, in spite of railways and telegraphs and other modern improvements, life is generally a little flat, amongst other expedients resorted to, somewhat to enliven matters, is the getting-up of small horticultural fêtes. These are usually carried out, partly under cover, partly *al fresco*, and a variety of mottos with floral embellishments may be seen on such occasions admirably arranged on the sides of the building or tent. There are certain inscriptions, however, which I have never seen put up, though they might be deserving the attention of the spectators. Suppose, in full view, were hung the proverb, "Live and let live," or this verse—

"Nought so vile upon the earth doth live,
But to the earth some special gift doth give."

In similar mottos a delicate hint could be conveyed to certain gardeners, who show a sort of spitefulness in the onslaughts they make upon the insect world around them. It is irritating—no question about that—to find that after much care and

attention, much head and hand work, an enemy, toiling insidiously at first, suddenly places his mark triumphantly upon our choice plants, flowers, or fruits, as much as to say, "That's mine, whether you like it or no!" But, still, I confess to feeling concern when I see an individual with a brow puckered in wrath pounce upon some helpless wretches belonging to the insect race, his expression implying that he considers death alone almost too good for them. Myself an insect-killer under some circumstances, I lie exposed to an extent to the *tu quoque* argument, yet there is a justification which I can plead; so also has the horticulturist, but he ought to remember (what many forget), that the injuries we receive from insects are more conspicuous than the benefits, and yet the latter are more numerous than might be supposed, and some of these are derived from insects which are deemed pests, and actually are so to some extent.

I venture upon these prefatory remarks, because when subsequently discussing the histories of a portion of the gardener's enemies, reference must be made to modes of extirpation—or, at least, of diminution, and thereby I may give a stimulus to insect slaughter. Personally, I shall probably reap one benefit, I shall eat fewer insects (for in spite of all the care of cooks, some species come to table at times); yet, on the other hand, should my dreams be haunted, like those of the old Greek hero, by the ghosts of my victims, I may behold, in addition to the insects which I myself have killed, those also which I have slain by proxy. Think of this, friendly reader, and go not to work too rashly in the task of insect-destruction; rather emulate the spirit Izaak Walton shows—when advising his pupil as to the best method of transfixing the worm upon the hook, he says that he is to handle it as if he loved it! Who knows but that the new generation of gardeners will be more sensitive than the past? Such a thing may be as that a man will be heard soliloquising after the manner of Sterne. Surveying a caterpillar on the path which he has just crushed, one might hear a gardener exclaiming, "Yes, there thou liest, poor creature! Thy life, brief to me, though seeming ages to thee, is momentarily terminated. Where are now thy sixteen legs (let me see, no, six legs and ten claspers), thy twelve segments? They are blended in an indistinguishable mass! Thy head, also, is a ruin—thy head, in which, perchance, there dwelt pleasing visions of days to come, when thou shouldst scorn earth, and pass in the aerial regions from flower to flower." However, this has not yet come to pass, and gardeners *now* look upon insects as their natural enemies, and kill them without superfluous tenderness. But, to speak seriously, the singularities of insect structure and insect habits, when they become known to persons of intelligence, do, indeed, awaken a very different feeling towards these creatures than may be expected to be found in one who, like Mr. Wood's friend alluded to in "Common Objects of the Country," supposes that caterpillars are "only skin and squash."

In my earlier entomological days my liking for insects having been perceived by some of my friends, I received one morning a donation in the shape of a wooden box, the contents of which the giver expected that I should be much delighted with. Opening it, there was in view the unsightly grub of the cockchafer which had just been disinterred. My gratitude for this rather undesirable gift was a little forced; butterflies and moths I loved, but beetle larvae were then rather beyond me. Throughout the winter months these creatures are turned up both in gardens and in fields, and not only by man accidentally, but intentionally by birds, rooks and starlings especially, and, as it often happens in similar cases, the birds are blamed for disturbing the soil when they rather deserve thanks.

The larva of the cockchafer (*Melolontha vulgaris*) is most injurious in those gardens, of which there are many throughout our land, which have approximating to them an extensive stretch of grass fields; in these the insects have their head quarters, and make incursions to the neighbouring garden ground. In the market gardens of some districts this larva has been noticed to be particularly partial to the roots of the Strawberry and the Rose; in meadows Lucerne and the cereals are frequently attacked by it, and there the results are more notable than in the instance of stronger and taller plants; the aspect in some cases leading us to suppose that some insect pest had attacked the growth above instead of below the ground. Figuiar seems to think that this insect is more abundant now than formerly, and because the land is more efficiently cultivated. The fact is well established that the female beetle chooses by preference light and manured soil when she can get it, which may seem to favour his idea; yet by the accounts which he himself gives of

the multitudes recorded to have appeared in other days, it does not appear that in recent times the cockchafer has done an injury equivalent to the increase of cultivated ground. In Prussia the species did much damage in 1835, and in France in 1854. But farther back we have astonishing accounts of the profusion in which cockchafers appeared, making due allowance for exaggeration. In 1574 this species was abundant in England—so abundant, it is said, as to stop the working of mills on the Severn. Ireland, too, in 1688 had so great a profusion that the insects did much damage in their adult state, the sound of their wings at night being described as terrific; and, as a last resource, the Irish fell to and ate them. But it is most amusing to read, that the cockchafers, having caused a famine in some districts, were summoned to appear before an ecclesiastical court at Lausanne. Sentence was duly passed upon them, and they were ordered to quit the territory—a capital decision, the only difficulty how it should be enforced.

One thing is quite obvious in the history of the cockchafer. This is, that it appears periodically in more plenty, owing to the three years occupied by its transformations. 1865 and 1868 were cockchafer years in most places, so that we may presume that there will be more of the perfect insect than usual about in 1871. Other years a certain number of stragglers appear. I saw the insect in various places during 1869 and 1870. This remark, of course, applies only to the cockchafer in its winged state; in the larval stage it is active enough in the interval, and likely to be most destructive towards the close of the third year; when getting sizeable it is still more voracious than when young. The eggs of the cockchafer are deposited in the ground by the female, with the aid of her first pair of legs; the number of eggs usually being about thirty. Hatching in a few weeks, the young larva immediately begin to feed, though at first they are only moderate consumers. In the winter, at least during the severe part of it, they become torpid, taking the precaution then to bury themselves at a greater depth. After numerous changes of skin, towards the autumn of the third year from their appearance from the egg, they are of mature size, and pass into the pupal stage. This is of brief duration, the beetle emerging in October or November, but, singular to say, it remains in the retreat, being very soft, until the spring, when it works gradually to the surface. Hence a sharp frost in the early spring sometimes gives a check to their increase by killing some of the beetles ere they are fully hardened; and in the same way also some of the larvae are destroyed. When we see cockchafers about in the daytime we are apt to form a very mistaken notion about them. Languid and stupid as they seem in the sunshine, which they always avoid when they can, they are lively enough after dark, and eat the leaves of various trees, and in places where they are particularly plentiful woods and parks suffer severely. It has been suggested as desirable that these insects should be hunted down in this adult state rather than as larvae; they may be shaken from trees during the day, and the killing of the females includes, of course, the destruction of their progeny. The only way of getting rid of the larvae is to turn over the ground, if you can, where they occur, and then they must be either picked up or killed by the sprinkling of some compound. In Russia, we are told, "the people have reached the advanced stage of making cockchafer flour, which at present is only employed for the purpose of making cakes for young pheasants, partridges, or quails." The common designation of the cockchafer larvae in many English counties is the "white grub." The Sussex folks are reported to call it "Job-hassett," a rather dubious name.

Amongst the dead leaves which are swept up in the vicinity of Gooseberry and Currant bushes, are some of the winter retreats of the Currant Moth (*Abraxas grossulariata*), and if these are not burnt, or otherwise effectually disposed of, the young caterpillars early in the spring emerge to renew their attacks on their favourite bushes. Many, however, remain on these through the winter, spinning a leaf to a twig as an anchorage, and, screened by this, defying the cold and the moisture: so that, in spare moments, the gardener will do well to pick off carefully any leaves he sees remaining, more particularly on the Gooseberry and Black Currant. The caterpillars, however, will, if need be, feed also on the Red Currant. A more effectual way of keeping this caterpillar under is to examine the leaves for the yellow eggs, which are laid in June and July. Mr. Newman states that he has often watched the female moths "not only in the evening, but even in the middle of a warm day, depositing a single egg on a leaf of Gooseberry or Black Currant, and then flying off to another." According

to my experience in our gardens at the west of London, the eggs are very often laid in small patches, sometimes about a dozen together. This species is notable amongst our Lepidoptera, as being one of those where there is a degree of resemblance between the colouring of the caterpillar and the

Abraxas grossulariata.

moth, though the latter is liable to vary. Hatched in the summer, these caterpillars make their appearance perceptible on the bushes, and in very warm seasons they will be of good size in the autumn ere the time of hibernation, though ordinarily they are but small when they cease eating. In the former case they are apt to verify the proverb, that "more haste is less speed," for becoming conspicuous on the Goose-berry bushes when the leaves are falling, they are a prey to birds, and never become noths at all. But it is in the spring months the gardener has most reason to dislike *A. grossulariata*, for the caterpillars go to work eagerly, and eat not only leaves, but also the buds, and even, as I have observed, the flowers in some seasons. The moth, which "flaps" very languidly about, rarely going far from its native spot, is commonly thought a butterfly by the unscientific.—J. R. S. C.

WORK FOR THE WEEK.

KITCHEN GARDEN.

THE state of the weather prevents much being done in the garden. See that the *Artichokes* are securely covered to prevent their being injured by frost. The young plants of *Cauliflowers* in frames must be protected from severe frost by covering the lights with mats; if there are any in the open borders protect them with arched sticks and mats. Lay a coating of long dung over the ridges of *Celery*, particularly that required for use, to preserve it from frost. Wheel manure to vacant ground when the weather is frosty and this can be done without injuring the walks, and let all spare ground be turned up so as to expose it to the action of the weather as long as possible. For land which has been long cropped with vegetables a dressing of fresh loam would in many cases be preferable to manure, and where this is wanted and can be procured, it should be in readiness, so that advantage may be taken of frosty days for wheeling it upon the ground. Where fresh soil cannot be obtained, charred vegetable refuse—such as prunings of shrubberies, edgings of walks, and many things which turn up in the course of the season, may be cheaply made to form an excellent substitute.

FRUIT GARDEN.

Make a point of regularly examining every week all the choice kinds of fruits that may be approaching ripeness, or which are found not to be keeping well, so that everything may be used at the proper time, for the finest Pears are worthless enough if allowed to become over-ripe before being used, and the same is the case with many varieties of Apples. Also look over the whole stock as often as time can be spared, removing any fruit that exhibit symptoms of decay, and put them aside for immediate use. Any of the choicer kinds of Pears that do not appear to ripen properly in the fruit-room, should be removed to a warm dry room for a few days. This will be found to greatly improve them. Keep the fruit as dry and cool as possible, and if the frost is excluded the fruit-room can hardly be too cool when the object is to preserve the fruit plump and sound for a long time. No newly-planted fruit tree should remain without a mulching over the roots. Standards must be securely staked, and they should afterwards be frequently looked to, as they are sometimes apt to get loose and rub against the stake; if preventive measures are not taken the trees will then be seriously injured.

FLOWER GARDEN.

The winter weather which we have lately experienced may have served to remind those who have neglected to afford pro-

tection to tender Roses, and other things which are found to require this care, that its application cannot with safety be delayed any longer. The flower garden is now of meagre interest, as there is little to be done save those routine operations which ensure high keeping. Take advantage of frosty mornings to manure Rose beds, and renew the soil in beds intended for masses of flowers. Endeavour to forward in inclement weather the preparation of labels and pegs for the beds, or any other article which will be wanted at this busy time of year. Put all implements in good order for work. Be not satisfied with having done things well, but be always striving to improve. Set your standard high, and endeavour to reach it. All planting should have been finished. Complete alterations when the weather is favourable. Any trees or shrubs loaded with snow should have it carefully shaken off. The places intended for Hollyhocks, Dahlias, &c., next summer, should be prepared by deep digging, and working-in plenty of rotten manure, for there is generally as much time to spare for this kind of work now as at planting-out time, and by preparing the spaces at the present season the soil will be in better condition than would be the case if the work were delayed until planting-out time. Shrubberies may be thinned, where this involves only the cutting-out of overgrown plants or lopping deciduous trees, but where evergreens generally require pruning, this is best done in March; for although, when the winter proves mild, such work may be safely performed at any time, it is safer to defer it till spring.

GREENHOUSE AND CONSERVATORY.

While frosty weather continues he satisfied with as low a night temperature in all plant houses as it will be safe to keep, taking advantage of bright days to increase the temperature, and using a little fire heat in order to be able to admit fresh air to dispel damp, &c. The proper night temperature for the conservatory very much depends upon the kind of plants it may contain. Where *Camellias*, *Epscrises*, *Heaths*, and other winter-blooming plants form the principal inmates, 40° will be sufficiently high, and with a dry atmosphere the temperature may safely be allowed to sink a few degrees on hard nights; but in cases where the hardier kinds of winter-flowering stove plants are brought in while in bloom, 45° should be considered the proper mean night temperature. Let whatever watering may be required be done early in the day, so as to allow advantage to be taken of sunshine, whenever that may occur, to give air for the purpose of drying the foliage, &c. Many persons appear to entertain an opinion that very little attention is needed to properly supply plants with water at this season, and they only look over their stock at intervals of several days. I would, however, caution young gardeners against this mistake, and advise them to examine every plant at least on alternate days, deferring the application of water until it is really required, and then giving a liberal soaking. Attend daily to the removal of dead and decaying leaves, and directly any of the flowering specimens become shabby remove them to some out-of-the-way place, taking care that they are placed under proper conditions as to temperature, &c., according to their wants, and, if possible, supply their places with others in full beauty. Where necessary, the leaves of plants should be sponged over and thoroughly cleaned, and twiners pruned, trimmed, and put into proper order for the spring. Early *Hyacinths* will soon be in flower, and with care a succession of them may be kept up till spring. For late flowering, the bulbs, if not already planted, should now be put in. The best pots are 5-inch (18's) for one bulb, and 6 or 7-inch (32's and 24's) for three bulbs; and when a fine display is sought for, three bulbs grown together in one pot secure that object much better than single bulbs. For potting, the soil should be as rich as possible, such as one-half fresh loam, cut from a pasture with the turf decayed in it, well-decomposed cow or horse manure, and a small quantity of clean sand well intermixed. If, however, this kind of compost cannot be obtained, then the lightest and richest at command must be employed instead. Drain efficiently, and after filling the pots lightly with the soil, place the bulbs upon the surface, slightly pressing them into the soil. After watering liberally set the pots, thus planted, out of doors on a dry bottom, and cover about a foot deep with old tan, ashes, sawdust, leaf soil, cocoa-nut fibre refuse, or any other light material. After remaining thus for a month, the bulbs will be sufficiently rooted to render it safe to remove them to a gentle bottom heat of about 55°, introducing the pots in numbers proportionate to the demand at intervals of about a fortnight. In this manner a succession of flowers will be secured until those in the open air come into flower. In forcing, en-

deavour to prevent the roots from penetrating the fermenting material.

FORCING PIT.

Succession plants and bulbs should be introduced and treated as previously directed. A weak solution of tepid manure water applied to almost every plant when showing flower will be found beneficial. Moderate fumigations with tobacco should be applied occasionally to keep the enemy at a respectful distance, prevention being better than cure.

COLD PITS.

Where the stock of bedding plants has to be wintered in structures of this description, the present will be found a trying time, and the utmost vigilance and care will be required to preserve the plants from harm. Apply sufficient covering to the glass, and also to the walls of the pits or frames to ward off the effects of the most severe frost, and embrace every chance of admitting air and removing decaying leaves, in order to prevent damp and mildew. Plants when covered up for several days should not be suddenly exposed to bright sunshine, but should be partially shaded for a few hours, admitting air in the meantime if the state of the atmosphere will permit.—W. KEANE.

DOINGS OF THE LAST WEEK.

WHAT fine suitable weather for this Christmas eve, with the roads like iron and the air some 20° below freezing point! How suitable, indeed, for all who have a comfortable home to go to, a nice blazing fire to sit round, and plenty of eatables and drinkables to keep out the cold! We are none the less thankful and grateful for the blessings and comforts we possess in our humble homestead; we none the less wish for all readers and friends (and one term might well do instead of two, as our readers are mostly our friends) a merry Christmas and a happy New Year, though we cannot help thinking on the wretchedness and misery now experienced by two great nations on the Continent, who are doing their best to injure and destroy each other. And coming close to our own doors, we cannot but think of the scanty supplies in many a household, owing to the want and the scarcity of employment at this cold season of the year. To every man with a spice of independence in his nature no greater boon can be given than the opportunity to labour, and thus support those near and dear to him. The making and finding work for a few weeks now would, in many districts, be the best of all charity, because there is no test like work for discriminating between the claims of those who may solicit our help. Some of us who think we have seen a little in our time are, nevertheless, often deceived. Well, it is better to trust a hundred times and be deceived than to have the wrapped-up selfish spirit, "never to trust at all." For all able-bodied claimants on our sympathy there is no test like the labour test. The shuffling, scheming idler will soon slip away; the honest, worthy man will be glad to continue and do his best.

The work of the week has chiefly resolved itself into the following:—Collecting and carting leaves, wheeling the rubbish heap on the kitchen garden, forming new rubbish heaps, turning over soil, digging and trenching when the weather would permit, and using a little litter for protecting Celery, Radishes, Lettuces, Cauliflowers &c. in cold earth pits.

Planting was proceeded with until the frost arrested us. It may be done on a sunny day, even if there has been a sharp frost, but it is always unadvisable to plant in frosty weather when the roots must be for any considerable time exposed to the frost. We have known large failures take place from this cause alone, even when the ground was not so hard as to prevent its working well. When planting on a large scale for forest or covert, the trees are often allowed to lie on the surface a little time before planting, and though that does no harm in a mild dull day, the roots are easily injured, if not destroyed, when exposed for a short time to a dry frosty air. This is a very different thing from the roots being partly placed in soil frozen in the natural way; as that takes place gradually, the roots are secured from the air, and have access at the same time to the storehouse of heat in the earth beneath them. This, which applies to common planting, applies still more thoroughly to the planting of shrubs and fruit trees with or without balls of earth. The roots should never be exposed to a frosty air. In planting, if the plants are valuable and of some size, too much care cannot be taken in spreading out the roots, and packing them in layers. When small plants are to be turned out in numbers, no better plan can be adopted than

giving the operator a stout ponch or apron to hold the plants, so that each may be only a short time exposed at the roots before the earth is fastened firmly round them.

Last season we made some remarks on planting by the dibber, and showed how the one oblique stroke did the planting, and far better than a dozen small strokes. For small plants nothing in general beats the dibber, but as we live we learn; and in some cases, as planting thousands of seedling Gorse for covers, we think in many cases, instead of digging and dibbling, the plants will do better if a deep slit be made by the spade thrust down, then moved from side to side in the firmish soil, the roots spread their full length in the opening, and then firmed by treading. We know that severe frost has no effect on such afterwards in comparison with small plants carefully dibbled. We have often had the latter loosened and next to thrown out of the ground by a severe frost.

Although repeating ourselves, we may remark there is nothing more difficult to get attended to by men taken on merely to give employment in planting than this—never to plant a shrub or tree more deeply than it stood before. Nature has clearly pointed out the exact place whence the stem should rise and the roots descend, and thousands of failures, as deaths and a languishing existence, take place every season, simply because that part of a plant that Nature intended to be exposed to the air is sunk down and covered with soil. It is so easy to do this, and the trees look so much firmer in consequence, that all but experienced planters will be sure to commit the error, unless at first carefully superintended. Thousands and thousands of trees die from this cause alone, and the proprietor hardly ever thinks of this as a cause of failure, partly because of the benevolent belief that any man who can wield a spade on an emergency can surely plant a tree well enough. We cannot say what the experience of others is in this respect, but in different parts of the country we have found it very difficult to get this simple matter attended to.

This is less to be wondered at when thousands who have little gardens have never acquired the knowledge how to use a dibber properly. Only last spring we saw some hundreds of Cabbage plants hanging their heads most dolefully. They were waiting for the rains and winds to plant them. A push from the point of the boot would have brought them up. They were what old gardeners would have called "hanged outright." Apparently they had all received half a dozen strokes with the dibber, and yet the plants were loose. Two good strokes and one small one are all that are needed in dibber-planting. There is the one perpendicular stroke with the dibber to make the hole for the roots, then the dibber, say from 1 to 2 or more inches from the first hole, is thrust in obliquely, so that the point comes to the bottom of the first hole, and then is quickly brought with the intervening earth to the perpendicular. The plant is fixed as in a blacksmith's vice, so that you will more easily break it than pull it up. These two strokes do the planting. A third stroke with the point of the dibber across the last hole, partly to fill it, makes the job more workmanlike. But a great point would be gained if the dibblers comprehended the simple fact that the two strokes alluded to, and not a number, make successful planting.

Ice Collecting.—We never had a better chance, and being rather short of cart power, most likely we shall recommence on Monday, as the weather seems likely to continue frosty, and we shall make holiday at another time. Last year we had to content ourselves with ice we did not like, and in our single house had a good store left after a very free use. The ice we have had now is very clear, from rain water in ponds. All ice on the top of water coloured from manure yards should be avoided, if possible. Dirty ice always looks badly, and when used for delicate purposes is apt to leave a taint behind it. The purer and clearer the water the better the ice, and the more free it is from weeds, sticks, &c., the better, as they only help to hasten its melting.

As far as our own practice is concerned, we are not so particular in pounding the ice as we used to be, provided we can obtain enough of small ice to pack the larger pieces. Leaving cavities of air between large pieces is to be avoided, and more especially if the air should not be below freezing point when filling the ice house, as then every such body of warm air shut in would act as a waster and melter. In very small houses the well-pounding will be essential to success. From some few experiments made we are rather convinced that if we could obtain ice in regular large blocks, as from abroad, and built these blocks in a regular mass, and cemented them together

with water in a frosty day or night, such a mass of blocks would keep better than the finest pounded 1-inch or 2-inch-thick ice from our ponds. In a moderate-sized house or heap, we would be more particular in having enough pounded to pack the larger pieces than in having all pounded small.

Protection.—Many vegetables and plants have been covered-up several days and nights since the frost came. The great point in these cases is to make sure that in such darkness from covering there shall be no excitement to mere prolongation from heat. Although we had been in the habit of allowing young Cauliflower plants under hand-lights to become slightly frozen before covering them up, as far as we recollect, Mr. Errington was the first to recommend the practice in writing. The principle is a very important one when continuous protection is given, and in severe weather that continuous protection is better for the plants every way than exposing them to sunshine by day and great colds at night. As above stated, the great point is to be sure that there is no growth.

Several times we have had such things as Calceolaria cuttings shut out from light and air for a month in severe weather, but then we made sure that the air enclosed ranged from 33° to 37°, or thereabouts. There will be little growth or elongation until you pass 40°. On uncovering such plants, Cauliflower plants, &c., after the thaw came, and even then uncovering gradually, the plants looked as fresh after a month of night as they would have done after the usual night of fifteen or sixteen hours. This simple matter rightly understood would often lessen labour. Many cold pits and frames are uncovered and covered every day in severe weather, although they would be better if left for a time covered up, but only in such weather, and provided they were cool enough to afford no incentive to growth.

We have lately had appeals made to our sympathies, on behalf of gardeners who have to contend with a next-to-unbroken frost of several months in the counties in which they live. With every wish to oblige, we felt that in such a case we must pretty well keep our sympathies for ourselves and our *confères* nearer home. In such a case, with coverings for the roofs, or double glass, in winter especially, we think we could keep tender plants safe and yet not parch them up with fire heat; and in the case of plants that merely needed protection from frost, we would first let them be near the freezing point, and then keep them so by protection, and trouble ourselves but little with frequent uncovering. Gardening under such circumstances is a much easier affair than with us, where the weather is often so variable that in thirty hours we may have the thermometer at 20° below freezing point and 20° above it. It is not so much the cold, but the sudden variations in temperature, and alternations from wet to dry, that try plants and gardeners so much in this country, and make so many of us old and rheumatic before our time.

A thinking shrewd man in such weather as this, where there are heated glass houses would soon save the best part of his wages in fuel alone. To use a common expression of the day, there are as respects furnaces *stokers* and *stokers*, the one as distinguished for saving as the other is for wasting.

On this we do not enlarge, as it has lately received some attention; but we would like to notice one thing in the way of protection, alluded to, we think, last year, but perhaps not yet sufficiently noticed so as to enable us to see the benevolence of the Supreme even in such a simple matter as the greater penetrative power of warm air over that of cold air. Thus, with the temperature from 5° to 20° below the freezing point, it is no difficult matter, with a mat and a little litter frequently turned, to keep the frost out of a cold pit; but only let your temperature outside rise to 10° or 15° above the freezing point, and how soon will that rise in temperature find its way through all your covering! We presume the same principles of radiation and conduction act in both cases, but we have often been struck with the great difference in results. It would seem we are more able to keep out cold than to keep out heat, though by colour, &c., we can do a good deal as respects the latter.

Two hints we must here give to the inexperienced. First, when a change of weather takes place from cold to warm, do not at once expose plants that have been kept some time in darkness to the full blaze of a bright sun. Better remove the covering by degrees, and give at first a subdued light. Then, in the second place, use similar precautions in all cases where the frost, even in a limited degree, has found an entrance. Let the warmer air find its way in, and thaw gradually, before you remove the covering and its attendant darkness; then admit light, not all at once, but by degrees if the sun is bright. A number of years ago we could afford to make an experiment

with a lot of Calceolaria cuttings in a cold pit in January. They were all frozen a little before sufficient covering could be given. On the change of the weather one light was uncovered at once, before the plants were thawed inside; that light gave us few plants for the flower garden. The others were not uncovered for two days after the thaw commenced, and then were slightly shaded for a couple of days more; and though the little plants were pretty stiff with the frost, not one of them failed afterwards, and though shut up from three to four weeks, they looked, after the above precautions, just as if they had never felt the cold, and never had more than a night of the usual length.

But for the space occupied we might have said something of firing, but that and other general matters have been pretty well attended to of late. Meanwhile, in all heated houses, let us say to the inexperienced, that it is safer to let the thermometer fall 5° or 10°, provided that is within safety-point, than to have a high temperature from fire heat in such severe weather. Then, again, provided a little air is given at the apex early, so as to prevent drip from the glass, it is better to give very little air, so as to necessitate less fire heat. Avoid the extremes of fire heat and sun heat meeting together. Lastly, use no more water than is absolutely necessary. A plant will sometimes flag, not so much from dryness at the roots as from a sudden change from dull to bright weather, and a slight shading or dewing of the foliage would often be better than watering at the root. If keen dry frost should continue, a slight sprinkling of the stages and floors of plant houses will often be better than watering or even sprinkling the plants themselves. The wetter the soil in a pot the cooler will it become by evaporation and radiation.—R. F.

TRADE CATALOGUES RECEIVED.

J. Carter, Dunnett, & Beale, 237 and 238, High Holborn, London, W.C.—*Carter's Gardeners' and Farmers' Vade-Mecum.*
J. Veitch & Sons, Royal Exotic Nursery, Chelsea, London, S.W.—*Catalogue of Garden and Flower Seeds for 1871.*

TO CORRESPONDENTS.

* * * We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

CONIFER SEEDS.—R. H. W. thinks it would be to the advantage of seedsmen to advertise seeds of Conifers, as many, like himself, are desirous of purchasing them.

PRUNING A POMEGRANATE (*Subscriber*).—Against a south wall it is difficult to secure flowering from the trim appearance that is usually required. Thin out the old wood, and leave the small twiggy well-ripened shoots, which must be encouraged or there will be few flowers. Grafted plants are to be preferred to those not worked, as they do not grow so vigorously, but flower much more freely and longer.

RHUS COTINUS PRUNING AND PROPAGATION (*Idem*).—The only pruning required is to thin out the shoots which are very much crowded, and to shorten the irregular growths, so as to form a more compact head. There is but little necessity to prune to induce flowering, as it is very free-flowering in a well-drained warm soil and situation. It is propagated by seeds, and by layers, which root freely if made in spring and detached in the autumn. Cuttings of the ripened shoots strike if inserted in sandy soil in a sheltered place; it may also be increased by cutting the roots into lengths of 5 or 6 inches, and placing them about an inch deep in the soil.

SMALL MELON (*Idem*).—Queen Anne's Pocket is the smallest, and perhaps the handsomest Melon, but is of little use. Paradise Gem is a fine new sort, scarlet-fleshed, and is a fit companion of Pine Apple Gem, green-fleshed, an early and productive kind. Scarlet Gem is handsome and good; but for flavour perhaps no Melon can compete with the old Egyptian, which, however, is not handsome.

HEADING MAIDEN PEACH TREES (*Amateur*).—For fan-training the trees ought not to have the lowest eyes started; then cut them back to five or six eyes if these are close together, or if distant, to three. As your trees have started the lowest eyes, you have no alternative but to head above the second tier of shoots, shortening the lowest side shoots or laterals to four, and the two highest to two eyes each. If, however, the side shoots are wide apart, then head above the first two, and shorten those to two eyes, as shown in your sketch by the bars. There is no advantage in

such trees except for forming pyramids. For dwarf fan-training we do not like them. "Fruit Gardening for the Many," will suit you. It may be had from our office for five stamps.

CYCLAMENS AFTER FLOWERING (*Q. Q.*)—After they are removed from the sitting-room, place them in a pit or frame, and protect them from the frost. Keep them watered, and in June plant them out in a border protected from the direct mid-day sun. In August take them up and re-pot them, placing the pots on ashes in a cold frame. The soil at all times should be moist, but there is no necessity for watering after they are turned out into the open ground. When moved from the sitting-room, they must be kept safe from frost.

GERANIUMS IN ROOMS (*Idem*).—In frosty weather you will need a fire, but as long as the temperature does not fall below 35°, there is no necessity for one. It is necessary to keep out frost. There can be no question they winter better without fire heat than with it. So long as your room is above 38° have no fire, and keep the plants dry, giving a little water occasionally to keep the wood from shrivelling.

TRANSPLANTING STRAWBERRIES (*Idem*).—We would not remove the runners planted last August until February, or early in March if the weather be unfavourable in February. If carefully lifted, preserving to each a good ball, the plants will be little the worse, watering being carefully attended to in dry weather.

VARIOUS (*Q. Q.*)—As regards the small vinery which will not be put up until May, we do not think you would gain a season by your neighbour growing your Vines in pots from February to May; but you would gain a good deal if the Vines, instead of being grown in pots, had the roots laid out nicely in shallow baskets, and were thus started in the house, and the baskets were then sunk just as they were in a nicely made border in the end of May or beginning of June. With warm water and a little covering there need be no check to the roots, which there would be in turning them out of a pot. The Black Hamburg and Lady Downe's will succeed well enough in the same house, but the latter should be planted at the warmer end, and even then the bunches will only be getting fully ripened when the first have all been need. In a late house we have some Lady Downe's now not more than ripe, but the Hamburgs are quite sugary and showing signs of shrivelling. The chief reason for having the flue, as referred to at page 478, under the front stage is, that the heat rising there is more easily and equally diffused. A flue under the centre stage would give off just as much heat; but as heat always rises it would not so readily keep cold from the front glass. When we have heated houses by flues or pipes close to the back instead of the front wall, we have always liked to have more heating power. True, there will be a circulation, the heated air rising to the apex and falling down to the front. This is best done when the heating medium is partly confined, and there are openings in front with air flues beneath the floor connected with the heating medium. With the flue near the front, the heated air rises at once against the front and the lower part of the roof glass. In your case, however, if you had the flue in front it need not interfere with the planting your Vines inside. Heat ascends, and will not hurt the roots nor the stems if a foot from the flue. All the Pears you mention will do well as bushes or pyramids. We are surprised you do not place among them two favourites—Marie Louise and Louise Bonne of Jersey. In your case we would decidedly prefer bushes and pyramids, but we can have no objection to cordons, a capital plan for filling every spare space; and a little protection for them when in bloom would be desirable.

VINES ON GLASS-COVERED WALLS (*Amateur*).—There is no objection to the perpendicular glass remaining in front of the Vines during the winter. It will be more beneficial than injurious, though, all things considered, we should be inclined to remove it, and not replace it until the Vines began to grow.

PEAT SOIL FOR GERANIUMS (*Idem*).—It would be good to mix with your soil for Geraniums, but it will not supply, or only to a small extent, the deficiency of decomposing vegetable matter, as leaf soil or manure would do. Water freely in dry weather, and once a week with liquid manure; 2 ozs. of guano to a gallon of water will be sufficient, a plentiful supply being given, and not dribbled.

DETERMINING THE EXTENT OF A KITCHEN GARDEN (*A. B. C.*)—Your question admits of no conclusive answer. The wants of an establishment vary considerably, for it is not so much what each person eats, but what is to be placed on the table. We have no means of estimating the extent of ground that will be required for producing a supply of vegetables for each person, varying as people do in their likes and dislikes; but we have known a kitchen garden of three acres supply a family of thirteen members, and an average of fifty besides in the servants' hall; and an acre and half barely meeting the wants of a family of three, with nine servants; whilst we have known one-eighth of an acre supply a family of four, with five servants; and three-quarters of an acre supply seven, with four servants.

LIBONIA FLORIBUNDA LEAVES FALLING (*J. C.*)—We can only account for the leaves falling from the plant receiving a check. Probably it has been grown in a warm close atmosphere, and received a check in removal. We think it will recover. It is usual for the plant to lose a part of its leaves in autumn. We have it succeeding well in a greenhouse.

NAMES OF FERNS (*Idem*).—The Silver Fern is *Gymnogramma tartarea*; the Gold, *Gymnogramma ochracea*; and the green frond, *Litobrochia (Dryopteris) palmata*.

COCA-NUT FIBRE FOR RHODODENDRON BEDS (*C. B.*)—The fibre, which is the waste of the brush and mat manufacturers, is of no value for plants, though for plunging pots in and mulching it may have value. This fibre is very different from the refuse, which is so much valued as an ingredient in composts for plants. The latter is like mahogany sawdust, and is a good substitute for peat. It may, therefore, be used for mixing with the soil intended for Rhododendron beds and all plants requiring peat soil, though for Azaleas, Heaths, and all hardwooded plants, which for the most part have very delicate fibres, it requires to be old, two years not being too old. Used fresh it is too open for those plants. It is also valuable as a compost for Ferns and Orchids—indeed, there are few plants not improved by its application.

ACHIMENES TREATMENT (*A. B.*)—Remove them from the soil early after the middle of February, and place them in pans well drained, and filled to within half an inch of the rim with a compost of light fibrous loam two parts, leaf soil one part, and a fourth of silver sand. Place

them on the surface close together, but not touching each other, and cover lightly with fine soil. Water very carefully, but have the soil moist, and place the pans in a hothed with a bottom heat of from 70° to 75°. A Cucumber frame will answer well. In the course of a few weeks the plants will have grown a couple of inches; place them in pots or pans, taking them up carefully, and placing them about 1½ inch apart, the weakest at the sides, and the strongest in the centre. The pots should be well drained, and if pans are used they should not be less than 6 inches, better 8 inches deep. A compost of two parts turfy loam, one of leaf soil, and one of well-rotted manure, with a free admixture of silver sand, will grow them well. It is well to pot that a slight top-dressing of soil can afterwards be given. Return the pots to the hothed, or if not convenient, place them near the glass in a vinery, stove, or any house with a moist growing heat of from 60° to 65° at night, and from 70° to 80° or 85° by day. When they need staking attend to it, and top-dress with fresh compost. Let them have a brisk heat and a moist atmosphere, watering as required, but taking care not to make the soil sodden by too frequent watering, and, on the other hand, not allowing them to suffer from dryness.

VINES FOR A GROUND VINERY (*M. Ross*).—All of the Vines you mention will do; but we would recommend White Muscadine, Grove End Sweet-water, Early Maltingre, and Black Prince for your ground vinery.

GROUND VINERIES (*Subscriber*).—It may be possible to get one piece of glass 7 feet long, by 2½ inches, but the way in which ground vinerias are usually glazed is by the panes of glass being the width between the upper and lower frames, and of any length you please. They are usually 20 inches.

IMPORTING ORCHIDS FROM INDIA (*E. L. J.*)—The very best time for Orchids to reach England is during the months of March and April. By this restriction it is impossible for the plants to be sent from India in a growing or unripe state, and they arrive in this country exactly at the right time to make good growth the same season. The following is a short list of species to be found in the neighbourhood of Bombay:—*Aerides maculosum*, *odoratum*, *Fieldingii*, *crispum*, and *Warneri*; *Bolbophyllum*, various; *Cologone odoratissima*; *Dendrobium barbatulum*, *nobile*, and *Pierardi*; *Saccolabium guttatum*, *Sarcantium* several species, *Vanda Roxburghii*; and many others of less importance, especially *Dendrobium*.

DOUBLE GLAZING (*J. Mackenzie, M.D.*).—We are not aware of any regularly recorded temperatures under the different circumstances alluded to. We have mislaid the results of some small experiments of our own years ago; but we recollect that in cold weather, when we covered a two-light box with double sashes, though from the laps the enclosed space was anything but air-tight, that similar thermometers, one laid on the upper light and one on the lower light, so as to be easily seen, often showed from 5 to 12° difference. Will some reader help our correspondent to details more definite as to the difference in temperature between double-glazed and single-glazed houses?

HOT WATER CIRCULATING DOWNWARDS.—"Will Mr. Giddings describe how a pipe can start and descend 22 feet in 100 feet, and then return to the same point on a level? If, as I think, that the pipes have first a rise from some other house and the boiler the flow pipe, as Mr. Giddings terms it, is nothing more nor less than a return pipe, and has no practical effect whatever, neither does it help 'POOR GARDENER' or—H. BAILEY."

CALADIUMS (*E. C.*)—The party you mention says his mode of growing them differs but little from that described in more than one place in our pages, excepting that he uses poorer soil. His mode of culture is as follows:—After the plants are no longer ornamental they are set aside in some dry place, often a vinery, and but very little water given; still they are not kept quite dry, and when the foliage is quite gone the pots are stored in some place warmer than an ordinary greenhouse. In spring the Caladiums are brought out and re-potted, and placed in heat, using for the first potting a mixture of rough peat and maiden loam, with charcoal for drainage, and adding sand to the mixture if the peat does not contain enough of it. After growing a little while re-pot, using a much poorer soil this time, very often the sweepings of the potting shed, as a too rich material to grow in, however conducive to robust health, diminishes the high colouring which constitutes the beauty of this plant. He considers it unnecessary to maintain the high temperature so often recommended, as plants so reared are unable afterwards to endure a position in the conservatory.

NAMES OF FRUITS (*H. Howell*).—The Apples you have sent are Pigeonnet. The name certainly does not occur in the "Fruit Manual," but you will find the variety described in "British Pomology." It is only second-rate in England. Those you sent are good.

NAME OF PLANT (*Original Subscriber*).—*Cerastium tomentosum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE CHRISTMAS MARKET.

We promise ourselves, as soon as space will permit, to give an account of the Christmas market that may be interesting to our readers. At present, while the fast-recurring shows and the josts that follow them absorb our space, we are perforce content to notice the salient points of that which has just terminated.

No market ever opened with brighter prospects for the wholesale, or more gloomy for the retail, than the Christmas market of 1870. Poultry had been very dear throughout the spring, and it was said the high prices had caused those who had poultry to kill it young, believing—and we agree with them—that it was better to ensure a good present price than to run the risk of many months only to achieve the same result. Then it was said the French supplies, which are enormous during the Christmas time, amounting to many thousands of Geese and

Turkeys, would be altogether wanting, and so great prices were asked. Those who required the best goods were obliged to buy at very dear rates. Then the supply continued and buyers were shy, but the elements fought for the wholesale. A frost set in, and made it little risk and no labour to hold. But the arrivals continued and the sales were small; Christmas-day was coming, no sale afterwards, and prices wavered. Every time there was an hour's good trade an attempt was made to raise prices, but it failed, and they closed lower than they began; still, they were good and remunerating for sender and salesman. There was one point well worthy of notice. It is said, "Love laughs at locksmiths;" and we may add, Trade laughs at restrictions. On Friday, spite of Prussian invasion, famine, and riotous mobs, a very large consignment of Geese and Turkeys came in from France.

GAME FOWLS AT THE LEEDS SHOW.

In looking over the Game classes at the Leeds Show I sought in vain (with some few exceptions) for the well-formed, compact, and high-crowned bird of days gone by; indeed, it is evident that a certain portion of breeders discard quality for coarseness. Several pens consisted of very long-sided birds, the back running in a straight horizontal line, with ostich-shaped necks and carriage, long weak thighs and legs, flat tucked-up breasts, and these birds were spiritless. Birds of this class are mostly heavy-fleshed, and not possessed of that firmness and muscular power natural to a pure well-bred Game cock. I suppose some judges prefer this style of bird, but I have no hesitation in saying that cocks so formed do not bear the excitement, or changes, of confinement and travelling so well as, nor are they equal in constitution to, birds which are fall in the breast and girth.

In breeding we ought to strictly perpetuate soundness of constitution, selecting for parents those which are the best in shape and other particulars coupled with good health.—**YORKSHIRE.**

NEW STANDARD FOR LIGHT AND DARK BRAHMAS.

THE North-west (U.S.) Poultry Association, believing the European standard of excellence for Light Brahmats to be both incorrect and faulty, has in solemn convocation decided upon a new one, which we copy as follows from the *Poultry Bulletin*:—

DESCRIPTION.—A Light Brahma cock should have a well-defined pea comb, standing erect and firm, and leaning to neither side of the head.

Beak short, strong, and well curved, one-third of which should be of "horn-colour," or, more excellent still, a clean black stripe running from the nostrils to point of beak, and covering in width one-third of the upper beak; the balance bright yellow.

Wattles and ear-lobes of equal length, with throat full, hanging flesh with wattles, and showing a tendency to sluff the feathers below the wattles when past twelve months old. Neck long and well arched. Neck hackle, feathers long, flowing and well down over the back and shoulders, and in colour white striped with black, the stripes extending up from the shoulder one-third to one-half the way to the head.

Back broad, flat and rising into the tail in such a way that for the part where the neck slopes down to the back, and up the tail to the point where the sickle feathers slope down, the curve thus defined should be identical with the curve of a Brahma egg, end to end, with the larger end towards the neck.

The tail should be black, the sickle feathers falling not much below the tail feathers proper, which should be expanded so as to form the letter A, with the bar left out, and should be well supplied with nicely curled feathers between black in colour and black fringed with white.

The wing should exhibit strong muscular power, and when extended the whole under surface should be black or very black brown. The "primaries" black; "secondaries," the upper half of each feather black, and lower half white, primaries well tucked up under the secondaries and adhering close to the body, and when the cock exhibits an excited vigilance for his flock, should show a black line along the lower edge and around the point of the wing, but when composed showing the black line slightly if at all. Saddle feathers should be abundant, and with the feathers of the body, white in colour.

The legs should be a deep yellow, or approaching a reddish yellow down the inside of the leg; well feathered, but not so grossly as to give any indications of vulture hocks. The hock joint should be well defined and not lose its identity in the "fluff." The lower surface of the "fluff" of the posterior should come just even with the hock joint.

The form of the body such that it will be of equal depth through the body just in front of the wings and just back of the hock joint, from back to breast and to posterior.

The birds should exhibit energy to such a degree as to put to rout any appearance of laziness or lack of courage.

The colour designated as white in this breed should be of that peculiar colour found in milk as it is strained warm from the cow, and not after it has been skimmed of the cream; neither should the colour be allowed to run into a buff as seen in some so-called Brahma birds.

The hen the same. Should have the same general appearance as the cock, though only in proportion, excepting that the posterior should be more fully developed; and she being deprived of the long neck feathers should present a body more the shape of a cube, with the lower corners rounded off, and presenting a neck the feathers of which are black, edged or laced with white; those presenting the centre two-fifths of the width black, being more perfect than those exceeding or falling short of it.

A cock seven months old and weighing 8 lbs. and a pullet weighing 6 lbs., with other points perfectly developed, should be entitled to the appellation of perfect birds; greater weight and perfection being considered in the superlative degree.

Perfectness of comb and wattles, colour, and carriage in the cock are of greater consideration than mere weight, and weight and form of body one of the first considerations in the hens, as it is now conceded that it is from these respectively that such characteristics are derived and produced in the progeny.

Scale of points:—

Size	2	Legs—colour and feathering	2
Colour	2	of the same	2
Head, comb and neck	3	Symmetry	2
Wings—primaries well tucked up under secondaries	3	Condition	1
		Total	15

The scale of points, it will be seen, differs greatly from that of the "Standard of Excellence," much less stress being laid upon colour and size, and more upon head and neck, and good tucking-up of the wing.—**A BRAHMA BREEDER.**

DURHAM POULTRY SHOW.

THIS was held on the 20th and 21st inst. The following is the prize-list:—

COCHINS—CINNA—Cinnamon and Buff.—1, 2, and Cup, G. H. Procter, Durham. **CHICKENS.**—1, G. H. Procter. 2, C. Sidwick, Ryddlesden Hall, Keighley. *Any other Variety.*—1, G. H. Procter. 2, C. Sidwick. **CHICKENS.**—1, C. Sidwick. 2, G. H. Procter.

BRAHMA POOTRA.—1, E. Leech, Rochdale. 2, F. Powell, Knaresborough. **CHICKENS.**—1, E. Leech. 2, A. H. Thompson, Yorkshire.

DOCKINGS.—1, J. White, Warlaby, Northallerton. 2, D. Rutter, East Rainton. **CHICKENS.**—1, J. White. 2, J. Braithwaite, Northallerton.

SPANISH.—1, W. Atkinson, Bishop Auckland. 2, E. Brown, Sheffield. **CHICKENS.** 1, T. C. & E. Newbit, Epsorth, Lincolnshire. 2, H. Morson, Bishop Auckland.

POLAND.—1, W. R. Patrick, West Wincup, Lynn. 2, H. Pickles, jun., Barby, Skipton. **CHICKENS.**—1, H. Pickles, jun. 2, W. R. Patrick.

GAME.—Black-breasted and other Reds.—1, T. Robson, Bishop Auckland. 2, E. Aykroyd, Ecclestone, Leeds. **CHICKENS.**—1, T. Robson. 2, T. Dent, Bishopwearmouth. *Any other Variety.*—1, E. Woodburne, Ulverston. 2, E. Winwood, Worcester. **CHICKENS.**—1, L. Casson, Ulverston. 2, Dr. Huxley, Edinburgh.

HAMBURGHS.—Golden-spangled.—1, T. Mitchell, Willington. 2, J. Morton, Marley Hill. **CHICKENS.**—1, J. Brown, Sunderland. 2, Ashton & Booth, Broadbottom, Mottram, Cheshire. **Silverspangled.**—1, H. Pickles, jun. 2, G. & J. Duckworth, Church. **CHICKENS.**—1, H. Pickles, jun. 2, Ashton & Booth. **Golden-pencilled.**—1, J. Walker, Birstwith, Ripley. 2, H. Pickles, jun. **CHICKENS.**—1, R. Moor, East Rainton. 2, J. Preston, Allerton, Bradford. **Silber-pencilled.**—1, H. Pickles, jun. 2, J. Walker. **CHICKENS.**—1, H. Pickles, jun. 2, J. Preston.

BANTAMS.—Game.—1, 3, and Medal, T. C. & E. Newbit, Epsworth. 2, D. Hunter, Sunderland. *Any other Variety.*—1, J. Preston. 2, D. Hunter.

DUCKS.—Aylesbury.—1, E. Leech. 2, W. Stonehouse, Whithy. *Any other Variety.*—1, E. Leech. 2, C. N. Baker, Chelsea.

SWEETSTAKES.—1, J. P. Fawcett, Whithy. 2, J. S. Booth, Chesterfield.

ANY OTHER VARIETY.—1, G. H. Procter, Durham. 2, Mrs. T. W. Hurd, Stricklandgate, Kendal.

PIGEONS.

CARRIERS.—Cock.—1, H. Yardley, Birmingham. 2, E. Brown, Sheffield. **HEN.**—1, H. Yardley. 2, T. W. Kilburn, Bishop Auckland.

POUTERS.—Cock.—1 and Medal, T. Rale, Gilesgate, Durham. 2, H. Brown, Walkley, Sheffield. **HEN.**—1, H. Brown. 2, H. Cockton, Middlebrough.

TUMBLERS.—Almonds.—1 and Medal, W. B. & H. O. Blenkinsop, Newcastle-upon-Tyne. 2, H. Yardley. *Any Colour.*—1, W. R. & H. O. Blenkinsop. 2, G. J. Taylor, Fartown, Huddersfield.

BARBS.—1, H. Yardley. 2, H. Cawood, Thorne, Doncaster.

OWLS (FOREIGN).—1, J. Fielding, jun., Rochdale. 2, W. R. & H. O. Blenkinsop.

TUMBLERS.—1 and Medal, T. Rale. 2, W. B. Van Haansbergen, Newcastle-upon-Tyne.

FANTAILS.—1, J. F. Loveridge, Newark-on-Trent. 2, H. Yardley.

JACOBIENS.—1, T. Rale. 2, W. B. Van Haansbergen.

TURBITS. 1, R. Youll, Sunderland. 2, T. Rale.

THREE PAIRS.—Medal, T. Rale.

OWLS (ENGLISH), DRAGONS, or ANVERS.—1, T. W. Kilburn. 2, F. Graham, Birkdale. 3, T. Hopper, Langley Moor, Durham.

TUMBLERS (COMMON), MAGPIES, or NONS.—1, W. E. Easton, Hull. 2, T. C. Taylor, Middlebrough. 3, T. G. Hopper, Langley Moor, Durham.

ANY OTHER VARIETY.—1, T. W. Kilburn. 2 and 3, W. Bearpark, Ainderby, Northallerton.

SELLING CLASS.—1, W. R. & H. O. Blenkinsop. 2, J. Irwin, Tanfield, Farnworth. 3, N. St-vobson, Durham.

JUDGES.—Poultry.—Mr. R. Teelby, Fulwood, Preston; *Pigeons.*—Mr. E. Corker, Croydon.

LOWESTOFT POULTRY SHOW.—At this Show, which will be held in January, Game, Dockings, Spanish, Cochins, and Brahmats, have each a cup for the first prize; there are four classes for Hamburgs, with a cup for the best pen; a cup for Bantams; and a point cup for Pigeons. The Committee deserve encouragement for the attention given to the birds, of which those arriving late are always marked in the catalogue

as arriving too late for competition, and catalogues, if requested, are sent by the first post after the awards are made.

GUILDFORD POULTRY SHOW.

We gave last week a report of this Show, but the prize list did not reach us in time for publication.

DORINGS.—Gray.—1, M. Putney. 2, J. Ivory & Son. Chickens—1, Cnp. and prize for best pen of Dorkings, C. Pannell. 2, J. Ivory & Son. 3, M. Putney.
BANTAMS.—1 and 2, F. James. hc, C. Howard & W. J. Nichols. c, C. Mottram.
Ducks.—Aylesbury.—1, Dr. Merriman. 2, A. B. Friend. hc, E. Hilder. Dr. Merriman. c, L. A. Consmaker.
Rouen.—1 and Prize for best pen of Ducks, J. Ivory & Son. 2, J. Pares. hc, E. Burce. M. Putney; J. Ivory & Son; G. Cubitt, M.P. Any other Variety.—1, R. A. C. G. Ansten (Summer Ducks). 2, W. Harzeaves (Call Ducks). hc, J. M. Molyneux (Call Ducks).
GEESE.—1 and Prize for best pen of Geese, E. Hilder. 2, W. Messenger. c, J. Pares; G. Griffin.
Goslings.—1, W. Messenger. 2, E. Hilder. hc, A. B. Friend. G. W. Attlee; J. Pares.
TURKEYS.—1, W. Messenger. 2, J. C. Ramsden. hc, G. W. How; Countess of Lovelace. Poults.—1, W. Messenger. 2, R. Harrison. hc, J. M. Molyneux; Countess of Lovelace; W. S. Smith (2).
ANY OTHER VARIETY.—1 and 2, G. Chilton (Creve-Coeurs). hc, A. B. Friend (Houdans). c, W. Virgo & Son (Houdans).

BARTON AND NORTH LINCOLNSHIRE POULTRY SHOW.

The third exhibition of poultry, Pigeons, singing birds, and Rabbits was held on the 23rd inst., under the most distinguished patronage. There were upwards of 160 entries in the various classes in the live poultry show, and about 80 in the poultry for sale, including poultry dressed ready for the spit. The arrangements were satisfactory, and the Show having proved a success, it is proposed to increase the prizes next year.

GAME.—1, F. Sales, Crowle. 2, J. Ward, Goxhill. Any variety.—1, F. Sales. 2, J. Hogzard, Barton. hc, F. Sales. 2, H. W. Armstrong.
SPANISH.—1, E. Wilson, Cottingham. 2, H. Charlton, Horncastle.
HAMBURGS.—Gold-spangled.—1, R. Robson, Hull. 2, J. Stamp, Barrow. Gold-pencilled.—1, G. W. Robinson. 2, C. Aston, Cottingham. Silver-spangled.—1, Master F. Astley, Elsham Hall. Silver-pencilled.—1 and 2, K. Robson.
BANTAMS.—Game.—1, Master F. Astley. 2, R. Robson. Any variety.—1, Hudson & Burnip, Epworth. 2, W. H. Tomlinson, Newark.
POLANDS.—1 and 2, J. M. Procter, Hull.
DORKINGS.—1, C. S. Britton, Hull.
COCHIN-CHINA.—1, Lovelidge, Cottingham. 2, J. Cross, Appleby.
ANY CROSS BREED.—1, Mrs. Cross.
GEESE.—1, R. Winship. 2, W. Searent.
DUCKS.—Aylesbury.—1, J. Williams, Wath-upon-Deane. 2, C. Simmons, Goxhill. Any variety.—1, Mrs. J. M. Procter. 2, Miss Wright.
TURKEYS.—1, Mrs. F. Bygott. 2, Miss Searent, Barrow.
SELLING CLASS.—2, J. Bilton, Cottingham. Chickens.—1, Lovelidge. 2, J. Bilton.
PIGEONS.—Nuns.—1, T. Waitt, Birmingham. 2, C. N. Lythe, Cottingham. Carriers.—1, J. Hairsine. 2, C. Newbold, Croppers.—2, G. Bruce, Trumpeters.—1 and 2, C. N. Lythe. Fantails.—1, C. N. Lythe. 2, T. Waitt. Any other Variety.—1, Hudson and Burnip. 2, T. Caparn.
CANARIES.—Any variety.—1, A. Lewis. 2, Haverson.
RABBITS.—Lop-eared.—1 and 2, P. Ashton. Any other Variety.—1, T. McLellan. 2, G. Cowper.

JUDGES.—Messrs. E. Newlitt, London House, Epworth; and J. Hodgkinson, Hull.

KIRKCUDBRIGHTSHIRE POULTRY SHOW.

This Society's third annual Show was held on December 16th in the Town Hall, Castle Douglas, a building well adapted for the purpose, and capable of accommodating many more pens. The Show was the best the Society has yet had, and was well supported by visitors, many pens changing hands.

The Game were but poor, but both classes of Dorkings were well represented, more especially the Silver-Greys, both adult and young birds of which were very good. Some of the Brahmas were above the average in size, colour, and marking. In the Selling class, Rouen Ducks were first and Dorkings second. In the Duck classes the Ronens were very good in all points, and the Aylesburries moderately good. In the "Variety" class White Muscovy were first and Brown Decey second. Among the Game Partridges there were some small stylish birds, but of the other kinds little can be said.

Among the Pigeons the Tumblers were good, the winners being Almonds; the Carriers and Pouters of moderate quality, and the Fantails very good. In the "Variety" class Archangels were first and Blue Turbits second.

There was also an excellent display of Gage birds, mostly of the Scotch Fancy Canary; and the Goldfinches were of unusual quality, the white-throated birds being of the rarest excellence.

GAME.—Black Reds.—1, J. Harding, Dumfries. 2, R. Kerr, Barjarg Tower. c, Mrs. G. Matland, Glenochter. Other Reds or Blues.—Chickens.—1, J. Harding. 2, R. Kerr.
DORINGS.—Coloured.—1, Gray, Ingliston. 2 and hc, Mrs. Mackie, Ernespie. Chickens.—1, Mrs. G. Matland. 2 and hc, Mrs. Bell, Hilltown. 3, Thomson, Blaket. c, Mrs. Mackie; N. Wilson, Croys. Silver-Greys.—1, J. Cunningham, Tarbolton. 2, A. Stirling, Croys. hc, Mrs. Hume, Auchendy. 3, Mrs. Congreve, Millbank. c, Mrs. Mackie.
CHICKENS.—1, B. Cunningham, 2, Mrs. Bell. hc, Mrs. Congreve. c, Mrs. Congreve; Mrs. Bell; Thomson.

SPANISH.—1, Mrs. Mackie. hc, M'Adam, Whitepark. Chickens.—1, Mrs. Brown, Arrebban. 2 and c, Mrs. Mackie.
COCHIN-CHINA (any colour).—Prize, Mrs. Knott, Dumfries. Chickens.—1, J. R. Storey, Millhead. 2, Mrs. Mackie (Buff). hc, Mrs. Mackie (Cinnamon); J. Thorpe.
HAMBURGS.—Golden-spangled.—Chickens.—1, Mrs. G. Matland. Silver-spangled.—1, J. Gibson. 2, R. Kerr. Chickens.—1, J. Gibson. 2, Mrs. Brown. hc, G. Pitt. Golden-pencilled.—2, Miss M. Loan, Hilltown. Chickens.—1, J. Gibson. Silver-pencilled.—Chickens.—1 and 2, Mrs. Hume.
BRAHMA POOTRAS.—1, Miss A. Stewart, Edinburgh. 2, Mrs. Congreve. Chickens.—1 and 2, Miss A. Stewart. hc, Mrs. G. Matland. c, Mrs. Congreve.
BANTAMS.—Golden and Silver-laced.—1, K. Bryden. Black.—2, R. Hughes. B. G. 1 and 2, J. Gibson. hc, J. Morrison.
GAGE BIRDS.—Black or other Reds.—1, 2, and etc. —Fotheringham. hc, J. Little. c, Thomson. Duckings and other breeds.—1, N. Wilson. 2, T. Ross, Auchendy. c, W. Little. T. Conchar, Castle Douglas.
ANY VARIETY.—1, N. Wilson (Houdans). 2, Miss Knott, Dumfries (Golden Poland). hc, Mrs. Hume (Houdans).
SELLING CLASS.—1 and 2, Thomson (Dorkings and Rouen Ducks). hc, Fotheringham (Spotted). 3, Mrs. Congreve (Dorkings); J. Cunningham (Dorkings). c, J. Shaw.
DUCKS.—Aylesbury. 1, Mrs. Brown. 2, General Johnston. hc, Fotheringham (2); Mrs. Carson, Mochrum. c, General Johnston; Mrs. Carson. Rouen.—1 and etc. —Thomson. 2, Gray. hc, Gray; Mrs. G. Matland; J. R. Storey. c, Gray; Mrs. Hume; Mrs. Congreve. Any other Variety.—1, W. Lottimer. 2, Mrs. Marchbank (Wild). hc, A. Muir (Muscovy).
GEESE (any variety).—1, Gray. c, Mrs. Laurie, Glenrobin.
TURKEYS.—Black Norfolk.—1, Mrs. Maxwell, Munches. c, M'Adam. Any other Variety.—1, Mrs. Mackie. 2, R. Carson, Milton Mill. hc, Mrs. Hume; Mrs. Congreve (2).

PIGEONS.

TUMBLERS.—1, J. Thorpe. 2 and hc, J. Turner. c, J. Arnott, Dumfries.
CARRIERS.—1 and 2, J. Thorpe. c, Miss Knott.
PUTERS.—1 and hc, Mrs. Mackie.
JACOBS.—1, Miss Knott. 2, J. R. Storey.
FANTAILS.—1 and 2, T. Douglas, Thornhill. hc, Miss Knott; T. Douglas. c, J. R. Storey (2).
ANY OTHER VARIETY.—1 and 2, Miss Knott (Turbits and Archangels). hc, A. Skirving (Turtle Doves); J. Turner (Owl); T. Douglas (Owl). c, Mrs. Mackie.

CANARIES.

LOCAL CLASSES.

YELLOW.—Cock.—1, A. Dobie, Castle Douglas. 2, J. Pearson, Castle Douglas. c, G. Black, Castle Douglas. Hen.—1, A. Martin, Castle Douglas. 2, John Scott, Castle Douglas. c, James Scott, Castle Douglas.
BUFF.—Cock.—1 and c, A. Martin. 2, J. Pearson. Hen.—1 and c, J. Shaw, Castle Douglas. 2, J. Pearson.
YELLOW PHEAL.—Cock.—1, W. Hamilton, Castle Douglas. 2 and c, W. E. Ham, Castle Douglas. Hen.—1, A. Martin. 2, W. Eaglesham. c, J. Shaw.
BUFF PHEAL.—Cock.—1, J. Shaw. 2, A. Martin. c, W. Hamilton. Hen.—1, A. Martin. 2 and c, W. Eaglesham.
GREEN.—Cock.—1, J. Shaw. 2, G. Maxwell, Castle Douglas.

OPEN CLASSES.

YELLOW.—Cock.—1, J. Thorpe, Dumfries. 2, R. Bryden, Lochmaben. c, A. Dobie. Hen.—1, J. Thorpe. 2, A. Martin. c, J. McQuhae, Maxwelltown.
BUFF.—Cock.—1, J. Thorpe. 2 and 3, A. Martin. c, John Scott. Hen.—1, J. Thorpe. 2, J. Shaw. 3, J. McQuhae.
YELLOW PHEAL.—Cock.—1, J. Thorpe. 2, R. Bryden. 3, W. Eaglesham. c, J. McFie, Springholm; J. Pocher, Southwick. Hen.—1, J. Shaw. 2, J. Pocher. c, R. Bryden; W. Eaglesham.
BUFF PHEAL.—Cock.—1, R. Edgar. 2, J. Shaw. 3, Mrs. Mackie. c, R. Bryden. Hen.—1 and 2, R. Bryden. c, Mrs. Mackie.
GOLDFINCH MULES.—1, A. Milroy, Newabbey. 2, J. Hume, Castle Douglas. c, J. McFie.
GOLDFINCHES.—1 and 2, A. Martin. 3, T. M'Taggart, Castle Douglas. c, J. Ireland, Castle Douglas.

PARROTS (any colour).—1, Miss Jardine, Castle Douglas. hc, J. Stewart.
FOREIGN BIRD.—1, A. Blyth. hc, Scott.
Mr. E. Hutton, Pudsey, judged the poultry and Pigeons.

HECKMONDWIKE POULTRY SHOW.

The following are the awards made at this Show, held on the 26th inst.:

GAME.—Black-breasted.—1, W. Fell, Adwalton. 2, J. Hodgson, Bradford. Brown Red.—1, W. Fell. 2, H. Beauland, Westgate Hill, Bradford. Duckwing.—1, S. H. and C. W. Mason, Drighlington. 2, W. Fell. White or Pile.—1 and 2, S. H. and W. C. Mason. Black or Brassy Wing.—1, J. Clayton, Gomersal. 2, J. Brook, Gomersal.
COCHIN-CHINA.—1, G. Wright, Cleckheaton. 2, H. Firth, Bradford. BRAHMA-POOTRA.—1, H. Butler, Bradford. 2, W. Firth, Burkeshaw. HAMBURGS.—Gold and Silver-spangled.—1, S. Smith. 2, H. Firth. Gold and Silver-pencilled.—1, S. Smith. 2, W. Jagger, Horbury. Black.—1, E. Hopkinson, Bradford. Any other variety.—1, H. Bowker, Keighley. 2, J. Powell, Bradford.
ANY BRED.—Cock.—1, B. Constantine, Littleborough. 2, W. Fawcett, Heckmondwike. Hen.—1, B. Constantine. 2, H. Beauland.
BANTAMS.—Red Game.—1, S. Smith. 2, G. Noble, Staincliffe. Duckwing Game.—1, T. Marsdon. 2, T. Dyson, Halifax.
PIGEONS.—Carriers.—1 and 2, B. Constantine. Antheers.—1, W. Firth. 2, J. A. Collinson, Halifax. Owls.—1, J. W. Watson, Bradford. Dragoons.—1, J. Schofield, Cleckheaton. 2, B. Barrill, Cleckheaton.

FALKIRK POULTRY SHOW.

The second Show of the Falkirk Association was held in the Corn Exchange on the 24th inst. The weather being the most severe that has been experienced for several years, it was a great drawback to birds that had to travel long distances, although on arrival they were well fed and cared for, and the building was very comfortable. Great credit is due to Mr. Roberts, the Honorary Secretary, for the attention paid to the specimens. The pens employed were Turner's, and, as usual, they were very satisfactory.

Adult Spanish were of moderate quality, but the young birds were of rare excellence. The cockerel in the first-prize pen, shown by a local exhibitor, was quite equal to anything we have seen this season. The adult Dorkings were also of fair quality, although some of the birds were bad in feet, and others had frosted combs. Dark-coloured were first, and Silver-Greys second and third. Of young Dorkings there were twenty-eight entries, and they were a very fine lot. In ad-

dition to three prizes and several high commendations the whole class was commended. Dark-coloured were here also first, and the others Silver-Greys; altogether the class was such as is rarely seen. *Cochins* were but moderate, the *Brahmas* little better, and the *Scottish Greys* not numerous, but of fair colour and marking. Of Gold-spangled *Hamburghs* there were twenty-two pens, and the class was good. The first-prize pen, to which the cup for the best pen in the Show was also awarded, was nearly perfection. The second pen was also good, and consisted of adult birds. The third-prize pen contained one of the most perfect cockerels ever seen; this pen only losing owing to the pullet being a little smaller in marks than the others. There were also twenty-two pens of Golden-pencilled *Hamburghs*, but with the exception of the three winning pens they were but poor. There was no class for Silver-pencilled. The Silver-spangled were not so good as we expected to see, with the exception of the prize-winners.

Of *Game* fowls there were some good birds, but several were badly matched; the first prize went to Black Reds, and the second to Duck-wings. The best pen in the Show was left out on account of the hen being swollen in the face, and another that would doubtless have appeared in the prize list was disqualified, having had the feathers trimmed.

In the "Any other variety" class, Mr. Pickles won with a fine pen of Silver *Polands*; the second being *Crève-Cœurs*, the third *Hondans*. The *Aylesbury Ducks* were tolerably good, but the *Rouens* were not at all such as we expected to find, and a nice pen of *Carolinas* was awarded the first prize against them. The *Turkeys* were mostly of the Norfolk variety, and were the best display of that kind we have ever seen, the size and colour being first-rate.

Game Bantams had thirty-four entries, and many of the birds were very good specimens. The first-prize pair were the best *Brown Reds* we have seen. The second and third-prize birds were *Black Reds*. Of the other varieties of *Bantams*, *Black Reds* were first and third, and *Solbrights* second. The Selling class presented a great attraction to buyers, the birds being uniformly good, and at the low price of £1 per pen. *Crève-Cœurs* were first, and *Dorkings* second and third.

In the *Pigeon* department there were but five classes, *Pouters* having the first position. *Blues* of good length and style were first; *Blacks* capital in colour and length, but rather thick in girth, second; and *Whites* of good properties third. The *Fantails* were very good in tail and carriage, but the *Jacobins* were not first-rate. Of *Tumblers*, a neat pair of *Yellow Mottles* were first, and *Almonds* second and third. In the "Variety" class *Letz* were first, *Red Turbites* second, and *Black Carriers* third. The remaining birds of this class were also good. The Show was well attended, and we think a great success.

SPANISH.—1, R. Somerville, Edinburgh. 2, W. Dickson, Slamanan. 3, R. Dickie, Alva. *hc*, J. W. Will, Errol. *c*, D. Duncan, Carron. *Chickens*—1 and 2, Lechl, W. G. Hardie, Carron. 2, W. Dickson. 3, A. Robertson, Townholm. *Kilmurck*. *hc*, A. McDonald, Easter Moffat, Airdrie. *hc*, E. Symon, Errol. *c*, W. R. Farquhar, Barrehead; D. Gollady, Meikle; R. Somerville.

DORKINGS.—1, D. Gollady, Meikle. 2, A. McDonald. 3, J. Malcolm, Langton. *hc*, M. Edwards, Hillon, Alloa. 2, W. Hays, Barrehead; G. Gordon, Errol; A. Carswell, Stenhousemuir. 3, W. Weir, Inches Farm. *Chickens*—1, T. Raines, Stirling. 2, Z. W. Heya. 3, J. Malcolm, Langton. *hc*, P. Gray, Tolly Well, Winchburgh. *hc*, D. Gollady; D. Duncan; W. Weir; W. Forbes; J. Turnbull, Carnock; A. McDonald.

COCHIN-CHINA.—1, Pollock, Busby. 2 and 3, A. Campbell, Larigs. *hc*, H. Paton, Larigs. *hc*, J. Brown, jun., Craigmill, Stirling. *c*, A. T. Williamson, Grangemouth; Com. G. F. Lyon, Kirkmichael, Dumfries.

BRADMA POOTRAS.—1, J. W. Morrison, Kirkcaldy. 2 and 3, T. Raines. 3, A. Robertson. *hc*, Miss Liddell, Edinburgh. *hc*, R. Brownlie, Kirkcaldy; W. R. Farquhar.

SCOTCH GAYS.—1 and 2, W. Gibb, Arndale. 3, T. Laurie, Linlithgow. *hc*, A. Binnie, Glasgow.

HAMBURGH *Golden-spangled*.—1 and Cup, J. W. Will. 2, H. Pickles, jun., Earby, Skip-on. 3, H. M'Nab, Barrehead. *hc*, A. Robertson. *hc*, S. & R. Ashton, Mottam; R. Dickson; A. Robertson. *c*, J. F. Loversidge, Newark-on-Trent; J. Hulburn, Stewarton, Ayrshire. *Golden-pencilled*.—1, A. Crosbie, Melrose. 2, H. Pickles, jun. 3, J. W. Will. *hc*, Dr. J. D'ulop, Clackmannan. *c*, Mrs. Harvey, Edinburgh. *Silver-spangled*.—1, J. Stewart, South Arthurie, Barrehead. 2, H. Pickles, jun. 3, S. & R. Ashton. *c*, D. Forrester, Woodcockdale, Linlithgow; J. W. Will.

GAME.—1, D. Duncan. 2, D. Harley, Edinburgh. 3, W. Chambers, Leslie, Fife. *hc*, J. W. Will; A. White, Camp, Motherwell; A. Hutchison, Grahamston Avenue. *c*, J. Logan, Carnwath; D. Harley; J. W. Blakey, Stirling.

ANY OTHER VARIETY.—1, H. Pickles, jun. (*Silver Poland*). 2 and 3, J. Logan (*Hondan and Crève-Cœur*). *hc*, D. Drazer, jun. (*Poland*). *hc*, A. Crosbie; J. Logan (*Black Hamburg*). *c*, J. Partington.

DUCKS.—*Aylesbury*.—1, J. W. Will. 2, R. Dickie, Alva. 3, A. Robertson. *hc*, D. Gollady, Meikle; J. T. Bell, Easter Batarvie, Canar Fife; A. Robertson; J. Logan. *c*, J. W. Will. *Any other Variety*.—1, S. & R. Ashton (*Carolina*). 2, A. Robertson (*Ronen*). 3, J. Harper, Blairlogie (*Ronen*). *hc*, J. Logan (*Ronen*). *hc*, J. Wilson, Linlithgow (*Ronen*); Com. G. F. Lyon.

TURKEYS (Any variety).—1 and 2, J. Wilson. 3, W. Forbes. *hc*, J. Logan. *c*, J. Turnbull, Carnock; W. Forbes.

BANTAMS—*Game*.—1, J. W. Will. 2, T. Raines. 3, D. Forrester, Woodcockdale. *hc*, Mrs. W. Stewart, Springfield, Barrehead. *hc*, R. Brownlie; R. Paterson. *c*, Melrose; A. Campbell; W. Dickson; W. Chesne, Salsburgh; D. Harvey. *c*, Main, Camelon; T. Raines; J. W. Will; J. Waidell, Airdrie. *Any Variety*.—1, S. & R. Ashton (*Black*). 2, J. G. Orr, Beith (*Gold-laced*). 3, H. Pickles, jun. (*Black*). *hc*, A. Frew, Sinclairton (*Silver-laced*); J. W. Will (*Black*). *hc*, J. G. Orr (*Silver-laced*); J. Archibald, Earlstone, Berwick (*Japanese*); A. Mitchell, Paisley (*Black*).

SELLING CLASS (Any variety).—1, W. Linton, Selkirk (*Crève-Cœur*). 2, S. Bell, Castleton, Fife (*Dorkings*). 3, J. M. Leach, Langs, Dorkings. *hc*, W. G. McDonald, Pitthead, Errol (*Dorkings*). *hc*, J. Turnbull, Carnock (*Dorkings*). D. Gollady, Meikle (*Dorkings*); R. Murdoch, Kilmilly (*Dorkings*); J. Williamson, Oxgangs (*Buff Cochins*); W. Dickson (*Game*); A. T. Williamson, Grangemouth (*Dorkings*); H. Pickles, jun. (*Polands*); Com. G. F. Lyon, Kirkmichael (*Dorkings, Brahmas, and Hondans*) (3). *c*, A. McDonald (*White Dorkings*); R. Dickie, Alva (*Spanish*); R. Murdoch (*Spanish*).

PIGEONS.

POOTRAS.—1 and 2, J. Mitchell, Glasgow. 3, J. Morrison, Morningside, Edinburgh. *hc*, A. Wright, Morningside, Edinburgh; J. Mitchell. *hc*, W. Moon, Edinburgh; J. Mair, Kilmarnock; A. Wright.

FANTAILS.—1, J. Mair. 2, A. Crosbie, Gattonside, Melrose. 3, W. C. Hardy, Carron. *hc*, J. G. Spence, Edinburgh; E. Hope, Kirkcaldy; R. Frew.

JACOBINS.—1 and *hc*, G. J. Spence. 2, R. Paterson. 3, Mrs. R. Frew. *c*, A. Johnstone.

TUMBLERS (Any variety).—1, J. Bruce, Dunfermline. 2, J. Mair. 3, A. Johnstone, Bathgate. *hc*, W. Elliot, Musselburgh; F. D. Wood, Edinburgh.

ANY OTHER VARIETY.—1, A. Crosbie. 2, R. Inch, Edinburgh. 3, J. Mair. *hc*, G. Forrest; R. Paterson; A. Johnstone.

JUDGE.—Mr. E. Hatton, Padsey, Leeds.

BINGLEY PIGEON SHOW.

(From a Correspondent.)

THERE was no Committee, the whole being entirely in the hands of Messrs. Beldon and Hawley, whose spirited attempt was well rewarded by one of the best displays of *Pigeons* seen in Yorkshire for some time. Turner's pens were used, and altogether the arrangements were good, and the birds cleaned, fed, and supplied with water in a most exemplary manner, but it is our unpleasant duty to record the fact that the public failed to appreciate the efforts of the proprietors of the Exhibition.

Ten *Pouter* cocks were brought together, the first-prize bird, a fine *White*, was well placed, and claimed at once, at the low price of £5. The first-prize hen was *Red*, and the second *Blae*, the latter very small and poor, the *Yellow* hen shown by Mr. Harvey and the *White* one by Mr. Sharp being in all respects superior. The cup for *Pouters* would have been much better given to the first-prize *White* cock than the *Red* hen to which it was awarded. There were some very good *Carrier* cocks both in eye and wattle, but the hens were rather a coarse lot, with the exception of the *Black* one, to which was given the cup offered for the best *Carrier* hen, or pair of *Short-faced Tumblers*. In *Almonds*, the first-prize birds were not so good in form and skull as the second-prize birds, but were better in ground colour, though the right eye of the cock was of a dark shade. For *Barbs*, foreign *Owls*, and *Jacobins*, there was also a cup offered, and this was won by Mr. Firth with a very fine pair of *Black Barbs*. Foreign *Owls* were badly placed, the second-prize birds being much smaller than the first, and much shorter and rounder in head; and the first-prize cock showed signs of romp. Both pairs were white. Of *Jacobins*, the best pair was left out—they were *Red*—no other pen approaching them in size, colour, and quality. The reason assigned for this was, that they were a little foul on the end of the flight feathers, although the first-prize birds were quite as bad in that respect. The *Trumpeters* were a grand lot; the first prize was awarded to *Light-mottled*, and the second to *Black*. In *Turbits*, *Reds* were first, but although good they were not strictly a match in colour. The second were very near *Blues*, and several other pairs might have been justly noticed.

There were twenty-eight entries for *Dragons*, the first-prize pair winning the cup against *Trumpeters* and *Turbits*; but this was considered the grand mistake of the Show, as the class contained some most extraordinary pairs, and with the exception of colour (*Yellow*), the first-prize birds were very bad. In the first place, the head and beak of the cock were coarse and curved, and he had pearl eyes, while the hen was straight in head and very flat on the skull, and she had red eyes. The best pair in the Show, belonging to Mr. Waddington, were dark *Blues*, and as nearly faultless as they can be bred.

There was a cup also for the best *Fantails*, *English Owls*, or *Antwerps*, and awarded very justly to the first-named variety, which class was very well represented.

In *English Owls* there has been great improvement, the birds coming up to the old standard, and there is no doubt that great difficulty was experienced in making the awards in this class. Of *Antwerps*, there were thirty-one entries. *Short-faces* winning both prizes, and both pairs were good. It would be well if these birds could be divided into two classes, of *Long* and *Short-faced* varieties.

The cup for the remaining classes was won by a very perfect pair of common *Red Mottle Tumblers*, the best we have seen, though the second-prize pair in the same class was little inferior to the former.

In the "Variety" class, *Ice Pigeons* won both the prizes, although we thought a pair of *Black Swallows* might have been given a position. The Selling class was well filled, and the restricted price being 50s., and the birds good, many lots were sold, though the first-prize pair of *Barbs* in that class had not presented many promising features.

We published the prize list and names of the Judges last week.

MY LIVE PETS.

THERE is no denying I am a lover of pets. My first pet (I cannot remember the darling) was a toad, which lived in the hollow of a fine old oak tree on the lawn. At that time my age was two-and-a-half, and I have been told that I daily used to toddle forth with a spoonful of my morning's bread and milk to feed "my dear pitty toad." I have seen the fine old tree, and the hollow in it, since I have been of more mature age, but not the toad; though I confess to still thinking both frogs and toads very beautiful in many respects, and very much maligned in many more.

Then came a tame *Jackdaw*, the delight of all our hearts. He regaled our affection by pecking our little bare legs just above the socks, and stealing our small treasures from the nursery play-box. On one occasion having watched us gather some blue hyacinths, and draw a plateful of long, red, tender radishes, he stealthily followed in our

wake, snapped off every hycynth he could reach, and pulled the green tops off all the radishes in the bed. On another occasion he was discovered, perched on the study table, a pen in his beak, with which, after dipping it into the inkstand, he deliberately scrawled over the pages of all the books lying open around him. The inky meanderings of his pen remain to this day to testify against him. I think poor "Jacky" finished his exploit by drowning himself in a "beck" which flowed at the bottom of the garden.

At this period I have a lively remembrance of the intense pleasure I took in watching the bees at their work amongst the flowers. We used to catch them in the bells of the Foxglove, carry them in their pretty little prisons to the greenhouse door, and let them in through the keyhole to fructify the blossoms of the melon and cucumber plants—not that we then knew why they were wanted in the greenhouse, but we were none the less proud when we had successfully escorted a captive thither.

As far as I remember the favourites which followed "Jacky" were a pair of pretty Wood Pigeons. The chief thing to be recorded of them, or rather of one of them, is that he or she pecked a thimble off my finger one day when I was feeding them, and swallowed it bodily. A poor frightened child I was then, I felt sure my dear Dove would die, and kept it shut up in its cage for days; but never a bit the worse was "Dovey." What became of the thimble I know not, nor can I recollect what eventually became of my Pigeons.

To these succeeded Rabbits, and a tame Hawk; the latter a most exigent pet, for he required a poor little bird to be sacrificed to him almost daily; but he was really tame, and truly affectionate, and on the sad day when "the children" were all dispatched to school, the poor Hawk screeched so incessantly and so discordantly he had to be given away.

Two dear little Hares came next, they were found by the mowers when cutting the hay, and were tiny Hares indeed—both could sit comfortably together in the palm of my hand. The men brought them to the rectory saying, "If anybody can keep 'em alive 'tis Miss Jemima." Never were two prettier little pets, or two prettier great pets when they grew up, for grow up they did. At first they were kept in "Miss Jemima's" bedroom, and fed on warm milk out of a bottle with a quill in the cork of it. The bottle was always deposited under my pillow when I went to bed, and "Tiny" and "Beas" tucked up comfortably in a basket of wool in a corner of the room. At early dawn, mindful of my nurslings, I invariably awoke, and putting my hand out of bed found the little creatures as near as ever they could get to me, close to the vallance of the bedstead. It was pretty to see them running after me about the house and garden, and had it not been for the domestic dogs and cats they would always have been at liberty. They grew and thrived, and soon ate bread and grass and clover, and all that hares ought to eat, but they never lost their love for milk, nor for their foster-mother.

I must pass over many other favourites, and come to the present family pets; not to speak of two beautiful, silky black and tan spaniels, almost human in their intelligence, and more than human in their obedience, unvarying affection, and wonderful noses, and an old grey tom cat, of whom much could be said. There are two tortoises, named Diogenes and Ulysses, who have the full range of a large un-walled garden, but who have never left its precincts, though naturally Ulysses is the more addicted to wandering. Their habits are very singular, and well worth watching, and they are decidedly far less shy and retiring than they were; they now do not object to dining in public, and Diogenes has a newly-acquired trick of giving a loud hiss, if taken up suddenly, or turned upside down; I presume it is expressive of his wrath and disapprobation. At the present time they have both hidden themselves, we know not where, for their winter snooze, and we shall probably see nothing more of them till April or May.

There is also a cage full of Canaries, and my last pet fact is connected with my birdies. A prisoner to the sofa for many months, owing to an accident, one of my chief interests was a pair of Canaries building their first nest. In due time four pretty blue-grey eggs, spotted with brown at one end, were deposited therein, and one morning, all a fortnight after the last was laid, I heard to my great delight a faint "chip" "chip" from the cage, and knew that the chicks were hatched. But alas! two days afterwards the cage fell down, the mother bird and her babies were jolted out of the nest, and either from some injury, or, as I believe from fright, the gentle little mother died in a few hours. The grief the loss occasioned need not be dwelt upon; carefully the nestlings were replaced in the nest, and I fondly hoped the cock bird, a most attentive husband and father, would bring up the children. He did his best—he fed them assiduously, but had no notion of "gathering them under his wing" so, though I covered them with wool as soon as they had had their last evening meal, before morning two were dead, and the third dying of cold. The poor little naked survivor I kept in my hand expecting momentarily it would die too, but by-and-by a faint piping was audible, which gradually grew louder and stronger. The warmth had revived "the motherless bairn," and it wanted its breakfast. It soon had some, and for the benefit of such of your readers as may be placed in similar circumstances, I will describe exactly what its food was:—An egg boiled quite hard and crumbled to powder, a little white well-baked bread grated fine, some scaled rape seed pounded, and as many of the black skins as possible picked out, a mashed lettuce, groundsel, or watercress leaf.

With this mixture my chick was fed for weeks; I put a little of it in

the palm of my hand and mashed it well together with half a drop of warm water. I then took a quill cut exactly like a pen, minus the slit, in one hand (having filled it with the food), and a wooden match in the other, and when the little mouth gaped open I put the quill quite down the throat, and pushed off the food with the stick; it was eagerly swallowed and more gaped for. I found by its pipings that the baby required to be fed every hour; at first two quills full satisfied it, and afterwards it devoured three or four at a meal.

I cannot say my child was pretty at first, but when fledged it was a fair, pure yellow Canary, and received the name of Fairy. I need not say my birdie was tame—it was more than tame, it slept in a tiny wadded basket by my side at night, and nestled on my pillow or shoulder by day. When Fairy was five weeks old, I went with a sister to a pretty seaside village eight miles distant; Fairy of course went too, but alas! and alas! one Sunday morning, when, as usual, it was perched on the pillow of my sofa, the room, and the house door being open, it floated a pretty brown butterfly, and off Fairy flew after it. The butterfly floated out again into the sunshine, with Fairy still in attendance. All day long the whole of the village, who had learned to love the tame birdie, were roaming the lanes and fields; many times the lost pet was seen skimming the blue sky, darting with the Swallows round the old ruined castle, or lighting on a chimney or housetop, but never near enough to be caught. It would perhaps be more faithful than wise to confess that a good many tears were shed while Fairy was thus enjoying herself.

At last all hopes were given up, and evening was closing in, when down came the fair little birdie, and lighted on its forlorn mistress's shoulder, and kissed her as if nothing had happened. Fairy has never had another out-of-door flight, but she has travelled a great deal for a bird, and brought up many dozen children of her own—brown, spotted, golden, and white—but none so cherished nor so tame as our pet Fairy.—C. J. S.

THE FLYING TUMBLER.

THE Flying Tumbler is the most general favourite fancy Pigeon. Its easy propagation and generally sound constitution render it most suitable to a young fancier; it soon establishes a hold upon his regard, which would not be the case, probably, with the more highly-cultivated breeds, which require more knowledge and care to breed and keep in health. Another recommendation is its low price, for every boy can raise sufficient money for the purchase of a pair of Tumblers, and we have no hesitation in saying that more true and staunch fanciers have begun with Tumblers than any, perhaps all, other varieties.

We may also claim as ancient a pedigree for the Flying Tumbler as for any of his high-born cousins, for the earliest writers were familiar with it, and record its amusing and merry habits, and how its more studious and intelligent admirers originated his varied plumage, and laid the foundation of that most exquisite and much-admired gem, the Almond of the present day.

The *Baldpate*, *Beard*, *Black*, *Red*, and *Yellow Mottles* of the old fanciers have still numerous admirers, although, as a rule, feather has been greatly neglected of late by the Flying fanciers. A few who combine a taste for feather with flying have taken the class of Tumblers represented by the engraving, and by care and perseverance have produced a few samples that possess some amount of merit. They are great favourites in and about Birmingham, and are as various in colour as the clear-legged birds, *Black* and *Red Mottles* or *Rosewings*, *Red-breasted*, *White-sides*, and *Yellow Whole-feather* among the dark-winged ones. The white-winged are divided into *Saddles* and *Badges*; and there are *Black*, *Blue*, and *Red Saddles*; *Black*, *Blue*, *Red*, and *Bronze Badges*.

They are free-flyers, and most of them rollers, mad or very sharp tumblers if they are allowed to fly; but it is seldom the best-feathered birds are trusted to the many casualties attending flying in a large town like Birmingham.

The original of the engraving was selected as the standard for the *Dark* or *Rose-winged* birds—*Mottles*—that is, the marking on the pinion should form or resemble a rose; there should not be any white elsewhere. The *Red-breasted White-sided* birds should be red all through the short and long flights, tail, and the whole of the body; the whole of the side or pinion *white*. The *Black* and *Blue Saddles* should be dark on the whole of the body down to the hocks, the muffs from the hocks to the toes' end *white*; the head should be evenly sprinkled or *badged*, the throat *bearded*, and for half an inch up the nose the width of the wattle also *white*; the back *saddle* marked as the *Magpie*. The *Red Saddle* the same as *Blue* and *Black*, with the exception of a *white* tail. The *Black*, *Blue*, and *Bronze Badges* should be marked on the head as the *Saddles*, the whole of the bird dark elsewhere, except the muffs

from the hocks and the ten long flights, which must be all white. The *Red*, again, must have a white tail, but in neither case must the white extend up the rump or under the belly. There is no established limit to the length of muffs; the majority favour a medium length—that is, from $1\frac{1}{2}$ inch to $2\frac{1}{2}$ inches; we have seen them $4\frac{1}{2}$ inches, which, to our taste, is excessive, and an impediment to the bird in walking.

Many credit the Dutch with the introduction of the *muffs* on Tumblers, but if they are correct in that statement, and correctly describe the Dutch Tumbler, we can simply say we have

done with that, as with many other foreign introductions, improved upon it.

Our taste requires a Tumbler to be a short, compact bird, and we for long thought it was the only shape that could tumble well, but we are now called to alter our opinion. Our late Secretary (Mr. Noyé) has forwarded from Turkey many specimens of new varieties, and amongst them a pair of *Rollers*, that would lead us to think the tumbling habit could be developed in almost any variety of Pigeon, so different are they to any Tumblers we ever saw. They are of a glossy black

plumage, like the Rook or Raven, long beak, long narrow head, neck slightly curved, excessively long flights and tail, the latter composed of sixteen feathers, rising a little like the Fantail, the legs short in hand. They are not so large as our muffed birds. They appear as though they could do as our friend has often told us they do—viz., “fly for nearly a day.” We are anxious to try their young; we shall not venture to try those we have.

The management of the Flying Tumbler has been so often

published we need say but little on that point; we will simply say, Keep your pen clean, give fresh water every day, plenty of old grey peas, old vetches, English wheat, and good sound barley. If you give any Indian wheat, do not do so either at the moulting season or to rear your young. Fly once a-day in the winter if the weather is favourable, and twice a-day in the summer—a means of keeping your birds healthy and up to their work.—BIRMINGHAM COLUMBARIAN SOCIETY.

AN AMERICAN REMEDY FOR FOUL BROOD.

I PROMISED to report how my refrigerator wintered its colony. The frames were covered with a piece of old carpeting, and the whole space outside the inner hive packed with straw and shavings. This spring it was in splendid condition, and it was found necessary to remove brood and cut out queen cells as early as the 20th of May; and for this locality the surplus would have been large if I had not been obliged to break up the colony on account of foul brood.

You can imagine my disappointment when my apiarian friend, Mr. Sweet, of West Mansfield, pointed out to me this loathsome disease in my choicest Italian colony early in June, when up to that time I had supposed that everything was prosperous with my twelve colonies. After a thorough examination I found six hives more or less affected, and, according to high authority, should be condemned to death. The other six appeared free from disease at this time, although three more subsequently became diseased.

This is my second summer of bee-keeping, and all the duties

pertaining to an apiary were entered into with the enthusiasm and—shall I confess it?—the ignorance and carelessness of a novice. Yes, ignorance and culpable carelessness, for in gathering empty combs from various quarters the disease was introduced, and spread among my pets. One hive in particular, of empty comb, had the peculiar odour, perforated cells, and brown viscid fluid, with which I have since become so familiar this summer; and it seems unaccountable to me how any person, with the *Bee Journal* wide open and Quinby's instructions before him, could be so careless as to give such combs to his bees.

But such was the fact, and foul brood spreading right and left. What shall be done to get rid of it? Shall Quinby be followed—purify the hive and honey by scalding, and treat the colony as a new swarm? or shall the heroic treatment of Alley be adopted—bury or burn bees and hive, combs and all? The latter has sent me some fine queens, but the former has always given reliable advice, and I shall follow his instructions

with two colonies which are past all cure, and reserve the others for treatment, hoping that I may find some cure, or at least palliative for the disease, and add my mite of experience, and, perhaps, useful knowledge to our *Bee Journal*.

Accordingly, June 8th, the combs of the two condemned colonies were melted into wax, the honey drained over and scalded, and the bees, after a confinement of forty hours, were treated like new swarms, and now, September 18th, are perfectly healthy and in fine condition for winter.

I will not occupy your valuable space with all the details of my experiments and fights (which lasted through three months), with the trials of doses of different strengths and kinds, with old comb and new, with young queens and old ones, and with no queen at all, and how in doing this I was obliged to keep up the strength of the colony for fear of robbers and of spreading the disease to my neighbours. Suffice it to say that after two months I had made no apparent headway, although still determined to "fight it out on this line, if it took all summer" and my last hive. In fact, I devoted my apiary to the study of this disease, and perhaps death.

Starting with and holding to the theory that foul brood is contagious only by the diffusion of living germs of feeble vitality (and I was strengthened in my conjecture in microscopical examinations, by finding the dead larvæ filled with nucleated cells), I determined to try those remedies which have the power of destroying the vitality of these destructive germs, these living organisms, and no remedies seemed to me more potent than carbolic acid and hyposulphate of soda. At first I used both, making one application of each, with an interval of one day, and with apparent benefit; but attributing the improvement to the more powerful of the two, I abandoned the hyposulphate and used the carbolic acid alone; and I was so infatuated with the idea of its superiority, that I did not give it up until three of the four hives had become so hopelessly diseased that the combs were destroyed, and the colonies treated to new combs (as it was late in the season), and freely fed with sugar and water. These are now in good condition for winter.

The fourth hive was carried away, the queen caged, and the colony strengthened with a medium-sized second swarm. After all the brood which was advanced had left the cells, I transferred the colony to a clean hive, thoroughly sulphured the old hive with burning sulphur, and stored it away in a safe place for future experiments. I now thought my apiary free from the pest, but on thoroughly examining the whole three new cases of foul brood were found—one very badly affected, and two slightly so, with, perhaps, twenty to forty cells diseased and perforated.

This was about the 1st of August, and again hyposulphate of soda was selected for the trial, and from the first application I have had the disease under control. Three days ago I examined the three colonies thoroughly, and found no new cells diseased in the two which had been the least affected, and in the almost hopelessly diseased one (as much diseased, in fact, as any of those that I destroyed) an entire brood had been raised, with not over fifty or sixty diseased and perforated cells, with dead larvæ remaining, most on one comb, and nearly all the cells contained a new supply of eggs; this colony is certainly convalescent, and I think now, from the recent and second application of the hyposulphate of soda, is entirely cured. Still, I should not be surprised to find two or three or even more perforated cells after this second crop of brood has hatched, as the whole hive, honey, and comb, had been for so long a time so thoroughly saturated with the disease, and at least two-thirds of the cells had, before the medicine was used, been filled with putrid larvæ. If so, I shall treat it to a third dose.

Now, Mr. Editor, as it is frequently of as much practical importance to tell how to administer a remedy as it is to know its name, I will ask your indulgence a little longer, hoping that others may improve upon my remedy, or, at least, test it, if they are so unfortunately ignorant and careless as I was in bringing "the wolf home to the fold."

The solution of hyposulphate of soda which I need was 1 oz. to half a pint of rain water. With this I thoroughly washed out every diseased cell with an atomiser, after opening the cap, also spraying over the whole of the combs and the inside of the hive. The instrument I use is a spray-producer, invented by Dr. Bigelow, of Boston, and sold by Codman & Shurtleff, of that city. There are two small metallic tubes a few inches long soldered together, and by placing the point of exit of the spray at the lower part of the cell, the whole of the contents of

the cell are instantly blown out upon the metallic tubes. With a very little practice there is no necessity for polluting the comb with the putrid matter. Place the comb perfectly upright or a little leaned towards you, and there is no difficulty; yet if a drop should happen to run down the comb it would do no harm, but had better be carefully absorbed with a piece of old dry cotton cloth. I quite frequently do this with the bees on the comb, as it does them no harm, to say the least, to get well covered with the vapour.

It is not at all injurious to the larvæ after they are two or three days old, though it may be before that time, as I have noticed that after using the hyposulphate where there are eggs and very young larvæ, the next day the cells are perfectly clean. There are many interesting points which have come up during my summer's fight, which I would speak of, but I have already gone beyond all reasonable bounds in this communication.—EDWARD P. ABBE, *New Bedford, Mass.*

[The editor of the *American Bee Journal*, from which the foregoing letter is extracted, directs attention to it in a leading article, in which he declares that "Dr. Abbe deserves the cordial thanks of bee-keepers, both in this country and abroad, for so generously and promptly making known his remedy, and the mode of administering it."]

COAL-TARRING THE ROOF OF A BEE-HOUSE.

I SEE in a volume of the old series of the *Journal* that asphalt is not considered a good thing to cover a bee-house with. I am constructing a new house, and thought of coating the roof, which is of wood, with gas tar. Do you think it would be injurious to the bees? Bee-houses are very useful in our bleak neighbourhood. I leave it open behind, only close it in bad weather with a garden mat.—A NORTHUMBERLAND BEE-KEEPER.

It appears to us that if asphalted felt is objectionable to bees, coal tar must be at least equally so. We should, however, be obliged by the opinions of such of our apian readers as may have had experience in the use of both or either of these somewhat mal-odorous materials.]

PARISIAN DOINGS UNDER THE MARKETS.—There is generally something picturesque in the manner in which our *confères* on the other side of the channel describe the commonest things; and, if now and then they draw upon their imaginations for the facts, their mode of expression is their own. A journalist thus describes the vaults of the great *Halles Centrales*, or market, of Paris:—"The vaults extend under the pavilions of the market, just as an underground warehouse corresponds with the shop above; and in these vaults, lighted by 1200 gas jets, a multitude of industrious workers pursue their daily avocations. They are:—The *compteurs d'œufs*, who count the eggs coming in and going out; the *mirieurs*, who, with the aid of a candle, investigate the anatomy of each subject; the *préparateurs de fromages*, who teach the Chester to mellow, the Gruyère to weep, the brie to run, and prick the Roquefort; the *rongeurs d'os*, who built up their merchandise espalier-wise against the walls, and do a capital business; common bones sell for 5 francs the cwt., but choice bones are worth three times that sum; the *manipulateurs de beurre*, whose operations are indispensable for the preservation of that delicate article; the *plumeurs, tuteurs*, and *rideurs* of poultry, who strangle sixty birds per hour, and strip one naked in five minutes or less; the *graveurs de Pigeons*, who receive five sous for filling the crops of a dozen Pigeons with grain from their own mouths." There is a poetry, of its kind, in everything.—(*Food Journal*)

OUR LETTER BOX.

SILVER-SPANGLED HAMBURGH'S EAR-LOBES SCABBY (*A Duffer*).—It may be the scab or scurf is the result of frost-bite; if so, camphor ointment is the treatment. If pecked by bees, remove him. If arising from humour, use compound sulphur ointment. There is no reason why he should not again be exhibited. It is impossible to tell his age; spur is not infallible as an indication. You need not, and should not shorten the spur, unless the bird scratches his legs or is impeded in walking. Allow him one pullet, or remove him to some place where there will be no temptation to fret. It applies to all birds.

SILVER-SPANGLED HAMBURGH COCK'S COMBS AND EAR-LOBES (*Novice*).—The comb of a Hamburg cock should be firmly seated on the head; should be well forward, but not overhanging the nostrils; it should have a single pike behind, inclining upwards; it should be full of points; it should be even at the base, no hollow in the centre, no inclination to either side; it should be wider than the skull, and longer than the head, but not greatly so. The ear-lobe of a Hamburg should be the size of a

fourpenny piece, and as white as it is possible to be. It should not, under any circumstances, exceed the dimensions of a sixpence.

DOCKING BANTAMS (*Dorking Bantams*).—We have heard no similar complaints to yours. The birds should have been put in the class for "Any other variety." The error in stating the age must have arisen from carelessness. We advise you to write to the Committee.

POULTRY HEADS AND BEAKS SCURFY (*Constant Subscriber*).—We should try to wash, or to scrape or file the beak, but it must be delicately handled. The head and neck we should treat with compound sulphur ointment, rubbing thoroughly twice or oftener every day. We should rub the beaks in the same way.

TURKEYS (*M. C.*).—The hens will not lay till April, perhaps later. If you wish to breed Turkeys, the eggs are worth hatching, but not the first five or six. You must be your own judge as to when the cock can be dispensed with. We can only tell you he is not necessary throughout the laying season. Having done all that is required of him, he may at once be sent away. Many do not keep one, but hire him for a short time.

KEEPING POULTRY FOR EGG-LAYING (*G. F. M.*).—As the cost is but small, we advise you to buy the "Poultry Book" published at our office, price 6d., and also Baily's, which can likewise be had from us. We advise you to read the article in one of our back numbers on poultry gardening, it will give you an insight. You can run the number you name on two acres, and the cocks will soon find out who is master, and accommodate themselves to circumstances. Each will take a little walk of his own. You will have to supply some little inexpensive helps if you keep one hundred and fifty on two acres, but it can be done. Not knowing the position of your land, and whether there exist any present help for a poultry house, we can only give you some general rules applicable to all cases. It is better to have three houses with fifty, or two with seventy-five, than one with a hundred and fifty to roost in, unless you have an old barn or very large and lofty place. It is not essential, but it is healthier. Your house may be made of wood, or of cheaper material if you have it. All that is required is that it be wind and water-proof. The ventilation should be near the roof. The floor should be above the surrounding level, and made of gravel or road grit. There should be perching room for every bird, and no perch should be more than 2 feet from the ground. This is all that is necessary. Nine times out of ten the money spent on poultry houses is thrown away.

HAMBURGH'S EAR-LOBE WARTY (*H. T.*).—We have no doubt the wart of which you speak is the result of an injury to the outer skin or sac of the ear-lobe. If the bird was exhibited with a hen, she probably pecked it. If by himself, it is an accidental injury. Under any circumstances keep him by himself till it is healed, and treat it with softening and healing ointments. If put with hens while the wart remains they are sure to peck it and end to the destruction of the ear-lobe.

FEATHER-EATING HEN (*Hamburg*).—It is probably one hen that eats the feathers of the cock. Find her out and remove her; but you must also remove the cock, and rub his throat daily with spermaceti ointment till the stubs of the feathers appear. He must not go among the hens till the feathers are so hardened and mature that they cannot be distinguished from the others. When he is put with the hens they must be watched for a time.

POULTRY FOR EGG-PRODUCTION (*G. C.*).—Brahmas' eggs are larger than the Hamburgs', but you must have patience. A pullet's eggs are much smaller than a hen's. The largest eggs are laid by Spanish and Creve-Coeurs. Our belief is that, taking the weight during the year, the Hamburgs would be beaten, but in numbers they are very prolific. At a season like this "an egg's an egg for n' that," and small as they are, laying Hamburgs with their eggs now fill their owners' pockets as well as their basket. Eggs have seldom been so scarce or so dear.

POINTS OF HOUDAN COCK (*G. J. T.*).—Yellow feathers do not disqualify a Houdan cock. Red ones do. It is very desirable a bird should have no colours but black and white. The comb has two irregular spines in front, separating and become wider apart to their extremities, springing from a root in front of the head, which has a flattened-heart appearance, and from which emerge comblets half way down the upper beak, where they end in a curious small spiral. No colour disqualifies a Houdan cock but red.

BUFF COCHIN COCK'S COMB TURNING WHITE (*Gamma*).—Perhaps your cock's comb is frozen; if it is, rub it with strong camphor ointment. Perhaps it is the disease known as "white comb." To cure that, dress it frequently with compound sulphur ointment.

BREEDING GAME BANTAMS (—).—If you had only Black Reds and Duckwings together, you would have some pure of both breeds, and many of them remarkable for beauty of colour, but having added the Piles, we fear they will be "neither fish, nor flesh, nor good red herring."

FEEDING POULTRY (*One Who is Without Eggs*).—It is said there is a locality where if the cry, "Stop thief," is raised, every man runs away, and so if a thousand letters about eggs were received, nine hundred and ninety-nine would bear the same signature as your own. If you were to kill one of your very fat fowls, you would find another confirmation of our remarks about the internal fat, and you would find that such a dietary as produced it was unwholesome in the extreme. You would find all your birds possessing "fat livers," providing you with the principal ingredient of a *pate a foie gras*. The intestines become so choked with fat, none of the functions can be carried on in a healthy manner; and the liver suffers the most. In a healthy state it is so dark red brown as to be almost black, while the gall bladder lies under the left lobe, very dark green and full almost to bursting. In a fowl that is fat inside, the liver is three or four times its natural size, of a pale watery colour, and the gall bladder of a like hue, flaccid, and empty. This is the result of over-fattening, or of improper feeding. You can buy ground oats at Agate's Mill, Slaughter, Crawley, Sussex. We have a sample from a nearer place on trial, and shall be happy to give our readers the result. They are quite distinct from oatmeal.

WEST GLAMORGAN SHOW (*T. Moore*).—We know nothing of the Show, and it must have been small, as the Committee did not advertise it. You b. 73: remedy against the Judge. Point out to the Committee the errors you mention, and if you are correct they should employ a more competent Judge next year.

CRYSTAL PALACE SHOW (*W. D.*).—All the prizes omitted in the official List are inserted in our last number, page 506.

RABBITS AT THE YORK SHOW.—Mr. Hudson says that there are two or three omissions in his note which have caused considerable misapprehension, and asks that the following be inserted:—"The medal was taken by a pair of well-matched Himalayas, belonging to Mr. Butterworth, Rochdale. Mr. J. Boyle, Jun., Blackburn, showed two pairs in the class. The does were gems, and best in the class, but the bucks were poor. A great many others were also badly matched. Angoras were only moderate, many being dirty and poor in wool. The 'Any other Variety' class was good. Mr. Boyle took first with a pair of Grey and White Dutch, the finest for points and colours I have ever seen; this pair being fortunately shown in a good light. The second prize was awarded to a pair of Hare Rabbits, splendid specimens, but badly placed for being seen. This class was well judged. Mr. Easton entered his fine old Silver-Greys, winners of above forty prizes. Mr. Boyle also showed Silver-Greys and Silver-Creams—the best bred in England, not forgetting the fine specimens shown by Mr. Royds, Rochdale. I think these Rabbits ought to have a class to themselves, seeing the Committee withheld the two first 2ls. prizes where cups were awarded.—S. G. HUDSON."

BINGLEY SHOW.—Mr. Firth won the cup for the best pen of Barbs, Owls, and Jacobins, as is mentioned in our report to day. We had a catalogue with the prizes written in, and Mr. Firth's winning the cup was omitted in it.

VARIOUS (*Berkhamstead*).—The purple berries of the overgreen Berberies are not injurious to fowls. Millet seed can be obtained of any wholesale corn dealer in London. The journals you mention are American.

TURBITS (*M. Tyler*).—We believe there has been some dispute as to the way a Turbit should carry its wings, whether above or below the tail. We incline to think the former is the correct carriage; and we are strengthened in this belief, as in every portrait of a Turbit from the time of the "Treatise on Pigeons" (A. D. 1755) to the present time, this bird is represented carrying the points of its wings above the tail. We believe there is no care for scrofula either in man or Pigeon. Apply lukewarm water with a bit of alum to the bird's eyes.

CARRIERS' THINGS (*A. B.*).—The feathers you mention would not absolutely disqualify the bird, but it would be better if they were not there.

BONEDUST FOR CHICKENS (*G. G.*).—Bonedust mixed with their soft food is good for any chickens.

METEOROLOGICAL OBSERVATIONS

In the Suburbs of London for the week ending December 27th.

- 21.—Overcast; snow; cold wind, sharp frost.
- 22.—Sharp frost; snow; clear and frosty.
- 23.—Intense frost; fine, frosty; clear and frosty.
- 24.—Intense frost; frosty fog; frosty fog at night.
- 25.—Sharp frost; cold wind; overcast and frosty.
- 26.—Overcast, cold wind; densely overcast; slight snow.
- 27.—Sharp frost; overcast; heavy fall of snow.

COVENT GARDEN MARKET.—DECEMBER 28.

Owing to the holidays business is almost suspended, and we shall have but few changes to report for another week. Good vegetables are somewhat scarcer, and will rapidly advance in price should this weather continue.
